

Mangaroa River

Streams alive!

What is *Streams alive?*

Streams alive is Greater Wellington's streamside assistance programme for high value stream catchments. It's part of our biodiversity programme to halt the continuing loss of species and ecosystems around the region.

Through the programme we support landowners who want to plant the stream margins on their property. The 12 catchments in the *Streams alive* programme are:-

- Waitohu Stream
- Otaki River
- Ration Creek
- Karori Stream
- Wainuiomata River
- Mangaroa River
- Owhanga Stream
- Upper Waiohine River
- Upper Ruamahanga River
- Kaiwhata River
- Waihora Stream
- Glendhu Creek

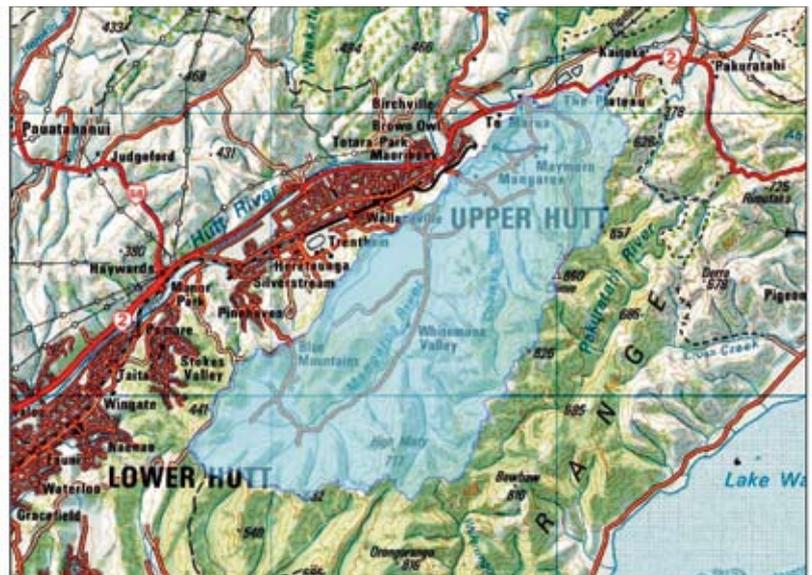

Greater Wellington has chosen the Mangaroa River as part of the *Streams alive* programme because streamside planting will make a difference to the overall ecological health of the river.

The variety of stream types, geology and climate influences in this catchment help complete the range represented in the *Streams alive* programme. As a whole the programme covers the full range of stream and ecosystem types present in the region.

The Mangaroa River is a tributary of the Hutt River and covers a large catchment in Whiteman's Valley, Upper Hutt. The catchment starts in the well-forested steep mountainous Rimutaka Range where the stream is clean and well-shaded, providing excellent habitat for a variety freshwater fish and insects. In the lower valley there are many small streams that have no shade cover to keep the water temperature cool and water weeds at bay, therefore decreasing the available areas that fish and insects can survive.

The Mangaroa River is in the *Streams alive* programme because:

- over 63% of the 10,310 ha catchment is in native or exotic vegetation
- around 25% of the catchment is protected by covenants
- the variety of stream types in the catchment provide home for a wide

variety of native fish which are likely to include shortfin eel, longfin eel, torrentfish, giant kokopu, koaro, dwarf galaxias, banded kokopu, shortjaw kokopu, inanga, lamprey, non-migratory bullies, common bully, giant bully, bluegill bully, redbfin bully, koura, and smelt

- the area contains some of the most extensive peat swamps in the region – these are in the lower valley
- evidence from streamside planting projects around the region indicates that if the few open areas of the river and its tributaries are planted, there will be measurable improvements to its overall ecological health.

How Greater Wellington can help

Greater Wellington can help landowners in *Streams alive* catchments by:

- drawing up a stream plan with the landowner showing an agreed programme for planting the streams and other waterways on the property
- supplying native plants suited to local conditions
- paying contractors to plant the plants
- paying contractors to undertake weed control for two years after planting.

Greater Wellington will not provide plants if they would create a flood management problem.

What will you have to do?

Landowners will have to:

- permanently fence off a section of the stream that will allow between two and seven rows of native plants to become established
- keep planted areas free of stock.

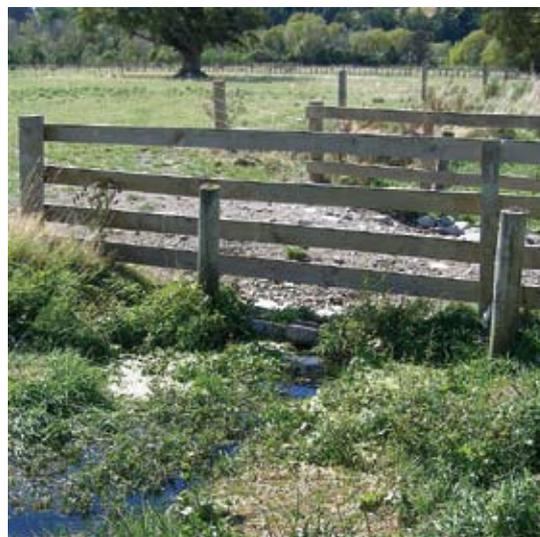

What changes will you see?

After just a year without stock access, the stream banks will be more stable. After about four years the plants will be about as tall as a person and will be shading out the weeds, starting to shade the stream, and providing habitat for streamside life.

In the long term, not only will the stream be healthier and much more attractive, you will also see more native birds in the neighbourhood. The stream will have cleaner water that will be more palatable to stock. You may even find that the stream becomes a feature that adds value to your property.
