15 March 2019

Environment Committee

Order Paper for the meeting of the Environment Committee to be held in the Council Chamber, Greater Wellington Regional Council, Level 2, 15 Walter Street, Te Aro, Wellington on:

Thursday, 21 March 2019 at 9.30am

Membership

Cr Kedgley (Chair)
Cr Brash (Deputy)

Cr Blakeley
Cr Gaylor
Cr Laidlaw
Cr McKinnon
Cr Ponter
Cr Swain

Cr Donaldson
Cr Laban
Cr Lamason
Cr Ogden
Cr Staples

Barbie Barton

Ihaia Puketapu

Recommendations in reports are not to be construed as Council policy until adopted by Council

Environment Committee

Order Paper for meeting to be held on Thursday, 21 March 2019 in the Council Chamber, Greater Wellington Regional Council, Level 2, 15 Walter Street, Te Aro, Wellington at 9.30am

Public Business

Please note these minutes remain unconfirmed until the meeting of the Environment Committee on 21 March 2019.

Report 19.45

14/02/2019

File: CCAB-10-689

Minutes of the Environment Committee meeting held on Thursday 14 February in the Council Chamber, Greater Wellington Regional Council, Level 2, 15 Walter Street, Te Aro, Wellington at 9:32am

Present

Councillors Kedgley (Chair), Blakeley, Brash (Deputy Chair), Donaldson, Gaylor, Laban, Laidlaw, McKinnon, Ponter, Swain and Staples.

Public Business

1 Apologies

Moved (Cr Kedgley/ Cr McKinnon)

That the Committee accepts the apologies for absence from Barbie Barton, Councillor Ogden, and Ihaia Puketapu.

The motion was **CARRIED**.

2 Declarations of conflict of interest

There were no declarations of conflict of interest.

3 Public Participation

There was no public participation.

4 Confirmation of the public minutes of 6 December 2018

Moved (Cr Kedgley/ Cr McKinnon)

That the Committee confirms the public minutes of the meeting of 6 December 2018, Report 18.585.

The motion was **CARRIED**.

5 **Action items from previous meetings**

Report 19.8

File ref: CCAB-10-675

Moved

(Cr Kedgley/ Cr Blakeley)

That the Committee:

1. *Receives the report.*
2. *Notes the content of the report.*

The motion was **CARRIED**.

6 **Geoffrey Blundell Barrage Gates – Project update**

Wayne O'Donnell, General Manager, Catchment Management, Graeme Campbell, Manager, Flood Protection, and Tracy Berghan, Principal Planning Adviser, spoke to the report.

Report 19.32

File ref: CCAB-10-681

Moved

(Cr Kedgley/ Cr Donaldson)

That the Committee:

1. *Receives the report.*
2. *Notes the content of the report, the need to improve the health of Wairarapa Moana, the recommendations of the Ruamahanga Whaitua, and the interests of landowners in the area.*
3. *Agrees to support the intent of the proposed conditions including:*
 - a. *That GWRC will undertake a comprehensive catchment wide review of the Lower Wairarapa Valley (which includes the LWVDS) in advance of 2027; and*
 - b. *That GWRC will as appropriate undertake active monitoring and research activities in the operation of the Barrage Gates in the interim period between 2019 and 2027.*

The motion was **CARRIED**.

7 **Review of the Wellington Harbour Risk Assessment**

Grant Nalder, Manager Harbours, (Harbourmaster) spoke to the report.

Report 19.28

File ref: CCAB-10-678

Moved

(Cr Kedgley/ Cr Lamason)

That the Committee:

1. *Receives the report.*
2. *Notes the content of the report.*
3. *Endorses GWRC's position as an active participant in the on-going implementation of the Port & Harbour Marine Safety Code.*
4. *Notes the on-going upgrades to navigation systems in order to mitigate risks identified by Risk Assessment as part of the Code process.*
5. *Acknowledges CentrePort Limited and their work as partners in the Port & Harbour Marine Safety Code, and encourage their continuing improvements to marine services in line with the Risk Assessments.*

The motion was **CARRIED**.

Noted: The Committee suggested that the Finance, Risk and Assurance Committee review this report and the risks identified in it, in particular, the need for inner harbour radar coverage and a salvage capable tug.

8 **Update from the Climate Change Working Groups**

Jake Roos, Climate Change Advisor (Acting) spoke to the report.

Report 19.29

File ref: CCAB-10-679

Moved

(Cr Blakeley/ Cr Donaldson)

That the Committee:

1. *Receives the report.*
2. *Notes the contents of the report.*

The motion was **CARRIED**.

The meeting adjourned at 10:45am and Councillor Laidlaw left the meeting during the adjournment.

The meeting reconvened at 11:07am

9 **General Managers' report to the Environment Committee meeting on 14 February 2019**

Wayne O'Donnell, General Manager, Catchment Management, spoke to the report.

Report 19.7

File ref: CCAB-10-684

Moved

(Cr Lamason/ Cr Staples)

That the Committee:

1. *Receives the report.*
2. *Notes the content of the report.*

The motion was **CARRIED**.

The meeting closed at 11:30am.

Cr S Kedgley
(Chair)

Committee Environment
Author Tim Sharp, Whaitua Programme Manager

Whaitua programme update – March 2019

1. Purpose

To provide information to the Environment Committee on the status of the whaitua programme and any key upcoming work.

2. Background

The whaitua process is a community-led, collaborative planning process to address a number of land and water management issues and carry out Greater Wellington Regional Council's (GWRC's) obligations under the National Policy Statement for Freshwater Management (NPS-FM). The programme aims to improve the integration of activities and achieve better resource management practices that reflect local aspirations.

The Wellington Region has been divided into five whaitua or catchments. Whaitua committees, consisting of community members, iwi representatives, partner representatives, and GWRC representatives will make recommendations to the Council through a Whaitua Implementation Programme (WIP) report. A WIP will contain strategies and actions that will form a programme of work for the management of land and water in that catchment.

The project involves partnering with mana whenua and as well as having significant community input, and connects with relevant stakeholders.

3. Ruamāhanga Whaitua and Plan Variation

The regional plan team is developing provisions for a plan variation for the Ruamāhanga Whaitua Chapter and associated provisions of the proposed Natural Resources Plan (PNRP). This is being done in collaboration with the Ruamāhanga Whaitua Committee who met with the plan team on 21 February 2019 to discuss progress.

Draft issues and objectives statements and associated evaluation under s32 of the RMA are being taken to Te Upoko Taiao – Natural Resource Management Committee when they meet next.

Other GWRC departments are also developing approaches to implementing other recommendations from the Ruamāhanga WIP.

4. Te Awarua-o-Porirua Whaitua

4.1 Progress since last quarter

Te Awarua-o-Porirua Whaitua Committee is in the final stages of completing its WIP.

4.2 Key work in the coming months

The WIP will be presented to Council on 10 April 2019.

Officers will review the WIP and consider how various departments, as well as Porirua City Council (PCC), Wellington City Council (WCC) and Wellington Water can work together to deliver the required outcomes.

Officers are discussing with PCC and WCC officers how their councils will receive the WIP. This is an important part of the process given many of the recommendations involve the territorial authorities.

5. Whaitua Te Whanganui-a-Tara

5.1 Progress since last quarter

Whaitua Te Whanganui-a-Tara Committee held its second meeting on 7 March 2019 covering general process matters (task, Terms of Reference, PNRP, NPSFM etc.), the chair election process, public engagement and communications.

Agreements to date include:

- The Committee will have co-Chairs – one from mana whenua and one from the wider committee. Kara Puketapu Dentice from Port Nicholson Block Settlement Trust (PNBST) has been elected as the mana whenua co-Chair. It was agreed that the second chair will not be an elected official. The second chair will be elected at Meeting 3 (11 April). Co-chairs will run meetings alternately starting Meeting 4 (13 May).
- Given the co-Chairing arrangement, there is a reduced need for active facilitation, although facilitative support to manage meetings is still required, e.g., so Chairs can be active participants. A facilitator will be appointed after the second chair is elected.
- A strategic vision document incorporating kawa and tikanga principles will be developed by the group over the next couple of meetings. This will provide a platform for the Committee to build on. A sub-group will begin this work immediately.

- A Whaitua Te Whanganui-a-Tara Facebook page and brand/logo will be developed.
- The Committee has connections into a broad cross-section of the community and there is a need for proactive engagement by all members. Key groups and networks and strategies for engagement will be developed.

The monthly meeting dates for the year have been confirmed.

5.2 Key work in the coming months

Next meeting on 11 April is to be held at Wellington Water Ltd. Agenda items include election of second chair, consideration of draft strategic vision, and a (probable) field trip to key WWL assets.

Communications Strategy will be activated including Facebook, brand, Neighbourly. This is being coordinated in conjunction with councils and Wellington Water.

Mana whenua appointments to the project team will be confirmed by Ngāti Toa and Port Nicolson Block Settlement Trust.

6. Communication

No external communication is proposed as an outcome of the consideration of this report.

7. Consideration of climate change

No decision is being sought in this report.

The matters addressed in this report have been considered by officers in accordance with the process set out in the GWRC Climate Change Consideration Guide.

7.1 Mitigation assessment

Mitigation assessments are concerned with the effect of the matter on the climate (i.e. the greenhouse gas emissions generated or removed from the atmosphere as a consequence of the matter) and the actions taken to reduce, neutralise or enhance that effect.

Officers have considered the effect of the matter on the climate.

Officers note that the matter currently does not affect the Council's interests in the Emissions Trading Scheme (ETS) or the Permanent Forest Sink Initiative (PFSI). However, recommendations made by the Whaitua Committees could provide a co-benefit of mitigating climate change. For example, the retirement and planting of erosion-prone land could give effect to sequestering carbon, however this will not be able to be further analysed until the Committees make their recommendations. Officers involved in this work will ensure this is considered in the final WIP reports.

7.2 **Adaptation assessment**

Adaptation assessments relate to the impacts of climate change (e.g. sea level rise or an increase in extreme weather events), and the actions taken to address or avoid those impacts.

Consideration of climate change adaption has been built into the collaborative modelling projects which support each whaitua project.

Climate change impacts on rainfall and catchment hydrology are being modelled and will be applied to the scenarios developed by the Committees. This information will allow for analysis of changes in contaminant generation, water allocation and flow, and the effectiveness of mitigations (such as storm water treatment, erosion and sediment control) on a catchment-by-catchment basis.

8. **The decision-making process and significance**

No decision is being sought in this report. This report is for Environment Committee members to receive an update on the progress of the three whaitua projects.

8.1 **Engagement**

Engagement on this matter is unnecessary.

9. **Recommendations**

That the Committee:

1. *Receives the report.*
2. *Notes the content of the report.*

Committee Environment Committee
Author Francie Morrow – Project Manager, Floodplain Management Plans

Te Kāuru FMP – Proposed FMP endorsement and approval for public consultation

1. Purpose

To seek:

- Endorsement of the approaches outlined in the proposed Te Kāuru Upper Ruamahanga Floodplain Management Plan (TKURFMP); and
- Approval of the consultation strategy seeking submissions from the wider community.

2. Background

The Environment Committee received reports on the TKURFMP project and TKURFMP Subcommittee meetings throughout 2015 and 2016. Subsequently, progress has been reported through the General Managers report. Additionally, the Environment Committee endorsed Volumes 1 and 2 for public engagement in June 2018. Volume 3 was presented to the Environment Committee for information at a workshop in February 2019.

The Te Kāuru area covers the upper Ruamahanga catchment from the confluence of the Waiohine River to headwaters, including the tributary rivers (The Waingawa, Waipoua, Whangaehu, Kopuaranga, and Taueru Rivers).

The FMP is being developed in collaboration with Masterton District Council (MDC), Carterton District Council (CDC), Ngāti Kahungunu ki Wairarapa, Ngāti Rangitāne o Wairarapa, and the wider community, primarily through the Te Kāuru Upper Ruamahanga Subcommittee.

The three volumes that were developed and engaged on with the public have now been combined into a single document, a “proposed FMP”, for a final round of consultation.

The contents of the three draft FMP volumes were:

- Volume 1 – Background and Overview (including Common Methods descriptions)
- Volume 2 – Reach Values, Issues and Rural Responses
- Volume 3 – Waipoua Urban Responses

FMP development is typically split into three phases:

1. Investigation
2. Identify and assess management options
3. Prepare FMP and implementation

Phases 1 and 2 have been completed for the rural and urban reaches. Phase 3 is currently being undertaken by preparing the FMP.

At a TKURFMP Subcommittee meeting on 13 March 2019, the Subcommittee endorsed the proposed TKURFMP and recommended that the Environment Committee approve the proposed FMP for public consultation.

3. Comment

Following a significant engagement process on the rural options, and then further engagement on the urban options, changes have been made to each of the volumes. A summary of the engagement processes to date is included as [Attachment 1](#) of this report. A summary of the changes made to Volume 1 as a result of public engagement is included as [Attachment 2](#).

The three volumes have now combined into a single document as a proposed floodplain management plan. We are seeking the TKURFMP Subcommittee endorsement of the proposed plan, and a recommendation to the Environment Committee for approval for undertaking public consultation to seek inputs and submissions from the wider community. The proposed FMP is included as [Attachment 3](#) of this report.

The content of the proposed FMP includes:

- Part 1 – Background and Overview, including Common Methods descriptions (primarily Volume 1)
- Part 2 – Reach Values, Issues and Responses for all rural and urban reaches (Primarily Volumes 2 and 3)

There are some significant changes to existing practices proposed within the FMP:

1. Collecting the local share of funding from a wider funding base
2. A revised governance structure which includes a formal advisory committee

3. Buffer management to allow the river more room to move within the buffer and riparian planting of the buffer
4. Additional expenditure to fund the implementation of the proposed plan

4. Communication

A communications and engagement plan for undertaking a consultative procedure is included as [Attachment 4](#) of this report.

Hearings are proposed to be during the week starting 29 May 2019. A separate report on arrangements for the hearings will be provided to the Te Kāuru Subcommittee at the meeting on 11 April 2019.

Pending support and endorsement from the Greater Wellington Regional Council (GWRC) Environment Committee, Masterton District Council (MDC), Carterton District Council (CDC) and iwi partners, the intent is to run public consultation events on the proposed FMP from 23 March 2019 until 7 April 2019. The final date for receiving submissions will be 14 April 2019. In view of the proposed FMP being available as an attachment to this report, we are advising the public that this document is available for feedback and submissions.

5. Consideration of Climate Change

The matters addressed in this report have been considered by officers in accordance with the process set out in the GWRC Climate Change Consideration Guide.

5.1 Mitigation assessment

Mitigation assessments are concerned with the effect of the matter on the climate (i.e. the greenhouse gas emissions generated or removed from the atmosphere as a consequence of the matter) and the actions taken to reduce, neutralise or enhance that effect.

Officers have considered the effect of the matter on the climate. Officers recommend that the matter will have an effect that is not considered significant.

Officers note that the matter does not affect the Council's interests in the Emissions Trading Scheme (ETS) or the Permanent Forest Sink Initiative (PFSI).

5.2 Adaptation assessment

Adaptation assessments relate to the impacts of climate change (e.g. sea level rise or an increase in extreme weather events), and the actions taken to address or avoid those impacts.

GWRC plans for climate change in assessing the degree of future flood hazard and in determining an appropriate response. There are only specific, limited situations in which climate change is not relevant (for example, planning for present-day emergency management).

In assessing flood hazard and determining appropriate structural and/or non-structural response in areas subject to flood risk, GWRC is applying a rainfall increase of 20% to the flood hydrology in the Floodplain Management Plan to account for climate change over the next 100 years.

Guidance from the Ministry for the Environment will be updated from time to time and our approach will be revised in line with any updates.

6. The decision-making process and significance

Officers recognise that the matters referenced in this report may have a high degree of importance to affected or interested parties

The matters requiring decision in this report have been considered by officers against the requirements of Part 6 of the Local Government Act 2002 (the Act). Part 6 sets out the obligations of local authorities in relation to the making of decisions.

6.1 Significance of Decision

Part 6 requires Greater Wellington Regional Council to consider the significance of the decision. The term ‘significance’ has a statutory definition set out in the act.

Officers have considered the significance of the matter, taking the Council’s significance and engagement policy and decision-making guidelines into account. Officers recommend that the matter be considered to have low significance.

Officers do not consider that a formal record outlining considerations of decision-making process is required in this instance.

6.2 Engagement

Engagement on the matters contained in this report aligns with the level of significance assessed. The following engagement processes have been followed to date:

- Engagement on Volumes 1 and 2 of the Te Kāuru FMP
- Release and engagement of updated flood maps for Masterton
- Engagement on possible flood management approaches for Volume 3, the Waipoua urban reach
- Engagement on the proposed flood management approach for Volume 3, the Waipoua urban reach

The next step of engagement is outlined in Section 4 of this report.

7. Recommendations

That the Subcommittee:

- 1. Receives the report.*

2. *Notes the content of the report.*
3. *Endorses the proposed Te Kāuru Upper Ruamahanga Floodplain Management Plan.*
4. *Approves the communications and engagement strategy to seek feedback from the wider community.*

Attachment 1: Summary of Stages 1 and 2 Engagement Te Kāuru

Attachment 2: Summary of changes to Volume 1

**Attachment 3: Proposed Te Kāuru Upper Ruamahanga Floodplain Management Plan
Revision 14 March 2019**

Attachment 4: Summary of Stages 1 and 2 Engagement Te Kāuru FMP

Summary of Stages 1 and 2 Engagement – Te Kāuru FMP

Through the development process of the Te Kāuru Upper Ruamahanga Floodplain Management Plan, there have been a number of stages of engagement with the community including riverside landowners. Table 1 summarises the engagements period that have been undertaken.

Table 1: Summary of stages of engagement

Stage	Dates	Purpose	Number of people engaged*
Stage 1	16 July to 16 September 2018	To seek feedback on draft versions of Volume 1 – Background and Overview and Volume 2 – Location Specific Values, Issues and Responses	400
Stage 2a	1 to 11 November 2018	To present updated draft flood maps for the Waipoua River through Masterton urban area	140
Stage 2b	6 to 9 December 2018	To discuss with the public the possible flood management approaches and options for the Waipoua River through the Masterton urban area	81
Stage 2c	23 February to 5 March 2019	To seek feedback and discuss the proposed flood management approaches for the Waipoua river through Masterton urban area, Volume 3.	189

*This number does not include social media, website hits or external publications

Stage 1 – Engagement on Volumes 1 & 2

Engagement activities

Stage 1 engagement was from 16 July to 16 September 2018 and was to seek feedback on the draft versions of Volume 1 – Background and Overview and Volume 2 – Location Specific Values, Issues and Responses. During this period the Te Kāuru project team and Subcommittee members attended a variety of engagement activities including:

- 22 small group discussions, called ‘coffee groups’, which were hosted by members of the community for riverside landowners;
- Stalls at the Masterton and Carterton Farmers Markets;
- Three drop-in centres; one in Gladstone, one in Carterton and one in Masterton;
- A district wide brochure drop to Masterton and a brochure drop to those in the Te Kāuru catchment in the Carterton district;
- Letters sent to riverside landowners;
- Information in the local papers;
- Social media campaigns;
- Paid radio interviews with Chair of the Te Kāuru Subcommittee Bob Francis and Councillor Adrienne Staples;
- Information on the [Te Kāuru](#) website.

Approximately 400 people engaged with us at various events, with many more reached via external publications, social media, and the Te Kāuru website and radio interviews.

Key themes

There were a number of key themes and questions identified as part of this engagement process. These were:

- Design lines
 - Are the design lines in the right place?
 - Are the design lines negotiable?
 - Will the design lines move further into private land?
- Vegetated buffer approach
 - What about weeds and pests?
 - How will it be implemented?
 - What are you going to plant?
 - Do I have to plant?
 - This is the best land, why plant it?
- Allowing the river room to move within the buffer
 - Are you basically going to let the river go?
 - Where's the science behind this?
 - How will you know this approach is working?
 - Why change? It's been working fine.
- Economic implications
 - Is this going to cost less or more in the future?
 - Is this proposal legal?
 - Can you provide an affordability analysis of the proposed costs and funding structure?
- Designation process
 - Have you sought legal advice?
 - What are the implications of designation?
 - Will the public have access to my land?
- Local knowledge and input
 - Will you listen?
- Western vs Eastern Rivers
 - The differences between the Western and Eastern Rivers is not clear in this draft FMP

Outcomes from engagement

Stage 1 engagement highlighted a number of areas where further work was needed. As a result the project team undertook a number of work streams to ensure the key themes were answered. These work streams were:

- Buffer benefits assessment (undertaken by Professor Russell Death)
- Pest Plant Plan
- Analysis of the buffers
- Buffer Implementation Plan
- Design line review
- Designations
- Funding structure
- Whaitua alignment
- Western vs Eastern River clarification
- Governance
- Gravel extraction
- Sediment movement and geomorphology
- Why change?

All of these work streams resulted in changes and clarifications within the draft FMP and in turn answered the questions people had asked throughout the engagement period. A separate response to specific questions asked during the coffee meetings was sent to each attendee.

Stage 2a – Engagement on updated draft flood maps, Masterton urban area

Engagement activities

Stage 2a engagement ran from 1 to 11 November 2018 and was to seek feedback on the updated draft flood maps for the Waipoua River through Masterton urban area. During this time engagement took the following forms:

- A small group information session with residents of Oxford Street (7 November)
- Stalls at the Masterton Farmers Markets on two consecutive weekends (3 and 10 November)
- Stalls at the Masterton Car Boot Sale on two consecutive weekends (4 and 11 November)
- A drop-in session at the Masterton Library (7 November)
- A letter and information drop to all residents and property owners in Oxford Street and affected areas of Akura Road
- Sit down with operators of Mawley Park
- Information in the Wairarapa Times Age (advertorial)
- Social media campaigns (including a brief [video](#))
- Information on the [Te Kāuru](#) and [Masterton District Council](#) websites

Overall approximately 140 people engaged with us at the various events. Again many more were reached through external publications, social media, the Te Kāuru website and radio interviews.

Key Themes

The key themes that were evident through this engagement were as follows:

- Rates
 - Why am I paying the same rates as everyone else?
 - Why am I disadvantaged just because I bought a house in Oxford Street?
- Hasn't flooded
 - These maps don't make sense
 - Modelling is misleading
 - Concern regarding insurance
 - Fake news
 - Mahunga hasn't flood since 1947
 - Local engineers do not think Oxford Street is at risk of flooding
- Fix the problem
 - Get on with doing something to fix the problem
- Local expertise should be used
 - You need a lot of local input. Experts that have been here a long time.
 - We've been here for decades. We want to make sure you are doing your very best to get it right.
- Mistrust
 - Some residents of Oxford Street don't believe these maps.
 - It was irresponsible of GWRC to release the 2014 maps
 - You screwed up Greytown, I hope you've learnt from this
 - So how much did it cost ratepayers to "prove" the 2014 model wrong?
 - Another muck up at huge cost by GWRC ! WHEN WILL THEY GET THINGS RIGHT 1st TIME ?
- Technical
 - Concern that rivers (Waipoua and Ruamahanga) will have coincident 1% floods
 - Concern regarding blockages at the railway bridge
 - Why don't you let the river scour out further to reduce the flood risk?
 - I don't believe in climate change. I've been around for 81 years and I've seen it all. It just comes in cycles.
 - This is all well and good as long as their long-term plan includes significant investment in stopbank maintenance, far too often stopbanks fail due to lack of maintenance.
- Experiences elsewhere
 - Lived in Taneatua during the 1987, 6.2 earthquake. Caused power and water to go out. Do we have any fault lines through this area? Is this factored into the modelling?
- Positives
 - What an interesting job you have – this is all very informative
 - Thank you, I'm glad someone is thinking about all this.
 - Pleased to hear that planning for the future is underway

- Engagement
 - Oxford Street residents wanted plain English communication and more notice for upcoming meetings.
 - Andrew Donald of Mahunga Farm has been very vocal in his disagreement of our approach. We are continuing to work with him.

Outcomes from engagement

Stage 2a of engagement has highlighted an on-going mistrust of flood risk mapping in the Masterton community. There was also a general appreciation from some community members of assessing the risk, and planning for management of the risk in the future.

Stage 2b – Engagement on possible flood management approaches, Masterton urban area

Engagement activities

Stage 2b engagement ran from 6 to 9 December 2018 and was to discuss with the public the possible flood management approaches and options for the Waipoua River through the Masterton urban area. A brochure outlining five flood management approaches was developed to distribute and discuss with the community. These approaches were:

- Improve conveyance of flood water
- Increased upstream storage
- Flood resilience and community preparedness
- Catchment management
- Upgrade or construct stopbanks

Engagement took the follow forms:

- A letter and brochure drop to all residents and property owners in Oxford Street and affected areas of Akura Road
- A small group information session with residents of Oxford Street (6 December)
- Stalls at the Masterton Farmers Market and Car Boot Sale (8 and 9 December)
- A drop-in session at the Masterton Club (8 December)
- Information in the Wairarapa Times Age (advertisement)
- Social media campaign
- Information on the [Te Kāuru](#) website

Overall approximately 81 people engaged with us at various events and again many more were reached through external publications, social media, and the TK website.

Key Themes

The key themes that were evident through this engagement were as follows:

- Oxford Street
 - 24 attended the meeting
 - Generally keen for action as soon as possible
 - Very supportive of being the first phase of work.

- Community ideas
 - Lower weir 0.5m or take it away. The one upstream of the bridge only used for the intake to Henley Lake
 - Continue Mawley stopbank upgrade
 - Have lined paths along the river and foot bridge to get to the railway station.
 - Beautification
 - Improve conveyance
 - Get decent stopbanks built
 - Use wetlands where practical
 - Why don't we fix it for a 1000 year event?
 - Realign the channel
 - Widen the river
 - Lower Colombo Road by 2m and use it as a spillway
 - You need to ensure the integrity of the stopbanks through Masterton as first priority before you do beautification
 - The solution may include a number of dams along the upper reaches
 - What about a dam?
- Hydrological assessment accuracy
 - The hydrology is wrong.
 - How old are your levels and cross-sections?
- Local knowledge
 - Have lived her for 70 years and never seen flood on Oxford Street.
 - In 1934 living in Smith Street, there was a flood so large boats were being used to get around.
- Storm-water concerns
 - Storm-water is an issue, I appreciate MDC are continually improving infrastructure, but more needs to be done.
 - Are we managing the storm-water as well as the river?
 - So has storm-water been considering in this?
- General comments
 - Why are we protecting Mawley Park before people's houses on Oxford Street?
 - Will my insurance company know once I'm no longer in the flood zone?
 - Needs to be done
 - Do all of them, pick the bloomin' lot!
 - We should let the rivers be natural and let properties erode/flood as we have let people live where they shouldn't

Outcomes from engagement

We had pages with each of the five flood management options on tables for people to put stickers on which options they supported. The results listed in Table 2.

Table 2: Support for various flood management options - community

Flood management option	Number supporting
Upgrade or construct stopbanks	8
Improve conveyance of flood water	8
Increase upstream storage	25
Flood resilience and community preparedness	9
Catchment management	9

The community conversations were generally positive, the community was pleased that plans were being made to manage flood risk. It was quite obvious, from community feedback that dams were thought of as a great opportunity for both flood protection and water storage. However when this option was reviewed the costs were prohibitive.

There was a desire from most people we spoke to, to manage the risk of flooding to Oxford Street as soon as possible. The residents of Oxford Street will need to remain a key stakeholder group for particular engagement and consideration, particularly during implementation of the FMP.

Stage 2c – Engagement on the proposed flood management approaches, Masterton urban area

Engagement activities

Stage 2c engagement was run from 23 February to 3 March 2019 to seek feedback and discuss the proposed flood management approaches for the Waipoua River through Masterton urban area, Volume 3.

An A4 folded brochure was delivered to all properties in the Te Kāuru catchment outlining the proposed five stage approach. The 12 page summary document, along with a letter inviting residents to a session at Mawley Park, was delivered to all houses on Oxford Street.

Posters advertising when and where Te Kāuru engagement would take place were put up in several locations in Masterton: New World, PaknSave, Public library (along with a Volume 1 and 3), Aratoi, and the MDC offices.

An updated version of Volume 1, as well as a summary of changes that were made to Volume 1, were also available.

The engagement took a number of forms, including:

- A meeting with members of the Papawai & Kaikōkirikiri Trusts (25 February 2019)
- A small group information session with members of a Waipoua Kaitiaki group (26 February)
- A letter and brochure drop to all residents and property owners in Oxford Street and affected areas of Akura Road
- A small group information session with residents of Oxford Street (27 February)
- Stalls at the Masterton Farmers Market and Car Boot Sale (23/24 February and 2/3 March)
- Two drop-in sessions at the Masterton Club (28 February and 2 March)

- Information in the Wairarapa Times Age and Wairarapa Midweek (advertisements)
- Social media campaign
- Information on the [Te Kāuru](#) website

Overall approximately 189 people engaged with us at various events and again many more were reached through external publications, social media, and the TK website.

Key Themes

The key themes that were evident through this engagement were as follows:

- Money
 - Where is the money coming from?
 - Will there be rating assessments for those directly affected?
 - If Stage 2 costs go up, following Stage 1 work, then you will need to review affordability
- Riparian planting
 - We (PK Trust) have a riparian planting 5 year plan, should we let GWRC know?
 - Will riparian planting benefit bird life/habitat and water quality?
- Removal of trees/conveyance
 - Will you clear larger trees to prevent blockages at the railway bridge?
 - So are you proposing to remove all the established trees?
 - The tree loss will be the hardest part for the community to accept.
 - I think there is going to be issues selling this concept (conveyance)
 - So you're saying if you lower the bank then there is more space for it to go? But what about the bottlenecks?
- Stopbanks
 - Where exactly are the stopbanks?
 - Where you have orange arrows on the map, is that where the stopbanks will go or is that the beginning and end of where they would need to be?
 - Stopbanks are a good idea
 - How high will the stopbanks be?
- Aquatic life
 - How does GWRC consider fish with this plan?
 - How will you manage the aquatic life whilst you are undertaking these works?
- Community ideas
 - You should widen the buffer, give the river more room
 - Since we are redesigning the river, is there a chance to add features? Like for kayaking?
 - Access to the river in some places could be enhanced.
 - I'd like to see a policy of having all natives and not exotics.
 - I think it would be a good idea to go down to the river and talk to the users on the river.
 - Instead of flattening that area and removing our plants, could you have a backwater area dug out instead?
 - A guy I know can build a stopbank for \$100k
 - Need to know more before we can make a decision. You can't even think about stages 2 to 5
 - Should put in a dam!

- It will be great to improve the recreation space alongside the Waipoua
- Weirs
 - What's its purpose?
 - Take the weirs out
 - Are they even legal? Did MDC get a consent?
 - Want clarification around weirs
- Storm-water
 - Big storm-water drain runs through the stopbank. It was put there in the 1960's
 - MDC should be here, make sure they are next time.
- General
 - You are using the wrong information. 19% is wrong, NIWA boss told me between 4 and 5%
 - What does 1% AEP mean?
 - When does the formal proposal come out?
 - What is community awareness?
 - What happens if the majority of town says 'let it flood'?
 - Historical rumours say the river bank is made up of sawdust.
 - It's a load of crap. You don't want to spend lots of money when it hasn't flooded here in 50 years. You just need a big dam.
 - Doesn't bother me, I'm on high ground, just let the rest of Masterton flood.
 - What about the kayakers? Are you ensuring it's safe for kayaking?
 - I heard a fella on RadioNZ talking about "Listen to the voice of the river" – *This was a popular and timely topic that came a up few times* – www.radionz.co.nz/raising-the-bar-how-to-make-our-rivers-healthy-according-to-dan-hikuroa
 - I'm a ratepayer so I should give it a read and some feedback.

Outcomes of engagement

Stage 2c of the Te Kāuru engagement process was reasonably short, 11 days in total; however we managed to connect with approximately 187 people during this time. The conversations we had were varied, as always, but almost everyone we spoke to supported the idea of a staged approach for implementing the outcomes for the Masterton urban area. The concept of gathering more data was acknowledged as important, particularly during the small group discussions.

TE KĀURU UPPER RUAMĀHANGA DRAFT FLOODPLAIN MANAGEMENT PLAN SUMMARY OF CHANGES TO VOLUME 1

Summary of major changes

We have heard what you had to say during the first round of engagement on the Te Kāuru Floodplain Management Plan. As a result of this feedback we have made a number of changes to Volume 1. Below is a summary of some of the major changes we have made.

Why Change?

During the Stage 1 engagement period many people asked “Why are we changing the way the river is managed?”. To provide further clarity around this question, additional information was added to the Drivers and Benefits section (Section 2.10), as well as the addition of ‘Why Change?’ in the title of this section.

Buffer Benefits

Questions were asked around ‘What would the benefits be for giving the river more room?’ and ‘Where is the science behind this?’ Following the commission of a report regarding the benefits and risks of buffer management by Professor Death (available at www.TeKāuru.co.nz), updates were made to Section 3.2.2 and Section 3.5.2 of Volume 1. These updates include specifying some of the benefits that giving the river more room and riparian planting of buffers will have.

Implementation of Riparian Planting of the Buffers

One of the main concerns raised during Stage 1 engagement was around how the riparian planting of buffers would be implemented. This included questions such as ‘Who will pay for it?’ ‘How do you decide where to start?’ and ‘Why should landowners lose land for plants?’ To address these concerns a number of changes and additions were made to Section 4.4.2. This includes two sub-sections on the costs and an implementation plan for the riparian planting.

Weeds

Many of those who provided feedback in Stage 1 indicated that they were ok with the concept of giving the river more room and riparian planting of the buffers. However, they had concerns around the management and responsibilities for controlling weeds and pest animals within the buffers, along with who would pay for this control. Section 4.4.2 now includes a section on how pest plants and animals are proposed to be managed as part of the FMP. There are additional two common methods that have been added to help clarify the roles and responsibilities for the management of pests. These are Section 3.2.7: Pest Management in Riparian Planted Buffers and Section 3.4.3: Riparian Management Officer.

Gravel Extraction

A number of questions were asked such as ‘Will gravel extraction change?’, ‘Can I extract gravel?’ and ‘How have the river gravel extraction cuts affected natural character?’ As a result of these questions, a new common method “Gravel Extraction and Analysis” (Section 3.2.4) has been included which gives an explanation of the gravel extraction process.

Funding

A wide variety of questions and concerns were raised in relation to the proposed funding structure. These included ‘Concerns around landowners losing their voice’, ‘Will this mean an increase expenditure?’ and ‘Will this mean I pay more or less?’ Within Section 4.3, the following has been clarified:

- » **How the funding changes relate to the targeted rate;**
- » **How the funding changes relate to GWRC’s Long Term Plan;**
- » **How the local share is derived; and**
- » **That the approach taken is legal and meets the requirements under the Local Government (Rating) Act 2002.**

Governance

Feedback received suggested that the proposed governance structure and explanation was too confusing. Section 4.1 has been updated to provide further clarity around how the proposed governance structure will work, which includes an updated diagram.

Impacts on Sediment

From the feedback received many people agreed with approach to give the river more room, but had concerns around what impacts this may have on the sediment, such as 'Will this encourage the erosion problem?' and 'Can't see how letting it erode and putting more sediment in is a good thing'. A report on the possible impacts of giving the river more room on sediment was commissioned by WPS Opus and is available on the Te Kāuru website. As a result, a small update to Section 4.4.2 was made to reflect the acknowledgement of the unpredictability of rivers and therefore it is difficult to say for certain what impacts may be.

Design Lines

Queries were raised by a number of landowners regarding reviews of the current design lines (i.e. the buffer area). As a result, a review 'hot spot areas' has been undertaken. Also, additional wording has been added to Section 3.2.2, along with changes to the affected reaches in Volume 2. The maps and a background memo of this review are available on the website (www.TeKauru.co.nz). As proposed in Section 4.4.2 a full detailed review of the design lines will be part of the implementation of Te Kāuru.

Designations

Some questions were asked requesting clarification on whether the proposals will mean that public would have access to privately owned land. There were also questions regarding changes to the flood zones and possible impacts on future subdivisions. Section 3.3.2 has been expanded to explain how designations work in further detail.

Climate Change

Questions were asked around 'What is the IPO?' and 'What have the climate conditions been like over the last 20 years?'. Updates were made to Section 2.9: Future Flooding and Climate Change to address these. This section now includes further information on the different climate cycles (El Niño and La Niña) and the possible impacts of climate change on the Upper Ruamāhanga catchment.

Summary of minor changes

- Clarifications regarding the different approaches to the eastern and western rivers have been made throughout Volume 1 of Te Kāuru, particularly noting that the western rivers have design lines, while the eastern rivers do not.
- A new section has been added to Section 2 (Section 2.2: Principles of River Management with Respect to Flood Protection). This is a direct transfer of the principles from the GWRC Flood Protection Code of Practice (COP) to ensure this FMP is in alignment with the COP.
- Another new section has been added to Section 2 (Section 2.7: Ruamāhanga Whaitua) specifically addressing the link between this FMP and the Whaitua.
- Sections 3.2.5 and 3.2.6 have been renamed to include riparian planting of buffers instead of vegetated buffers. This change in terminology also applies to other text within Te Kāuru that refers to vegetated buffers. This is to ensure better alignment with other GWRC departments and external agencies, as well as increase the opportunities of possible grants available for planting.

**We want to know if Te Kāuru is
heading in the right direction.**

PART 1: BACKGROUND AND OVERVIEW

Executive Summary

This Floodplain Management Plan establishes a framework that will help keep people and property safe by proactively managing flood and erosion risks throughout the Te Kāuru Upper Ruamāhanga catchment. Through this framework, the overall vision for the Te Kāuru Upper Ruamāhanga catchment seeks to establish:

**“A CONNECTED, RESILIENT, PROSPEROUS AND SUSTAINABLE
COMMUNITY, PROUD OF ITS RIVERS, THAT IS INVOLVED IN MANAGING
FLOOD RISKS IN A MANNER THAT RECOGNISES LOCAL IDENTITY AND
PROTECTS, ENHANCES OR RESTORES NATURAL AND CULTURAL VALUES”**

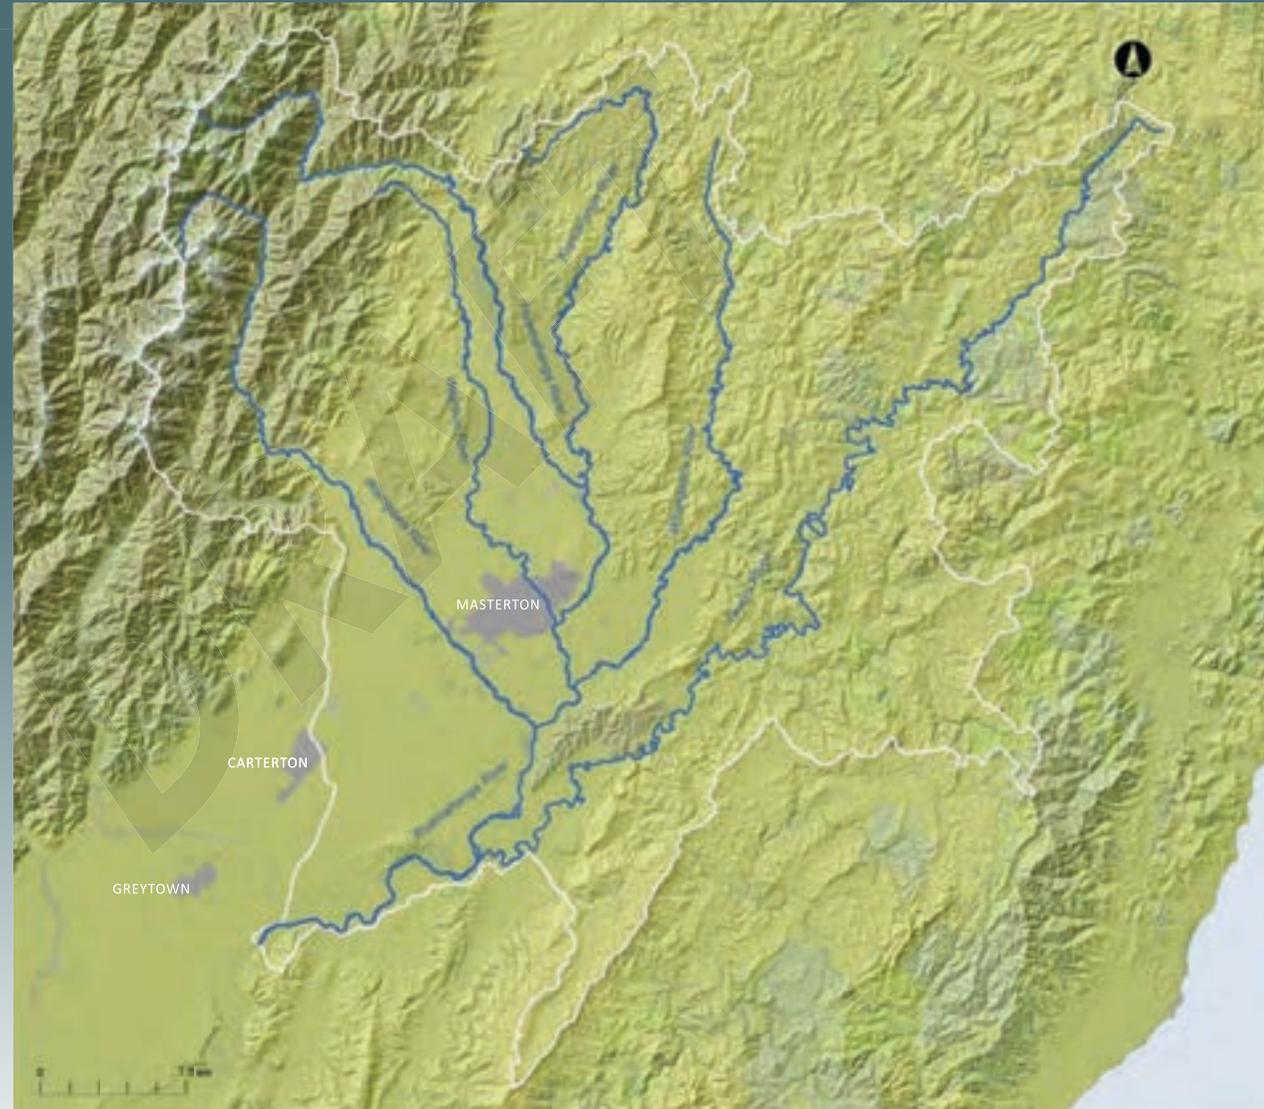

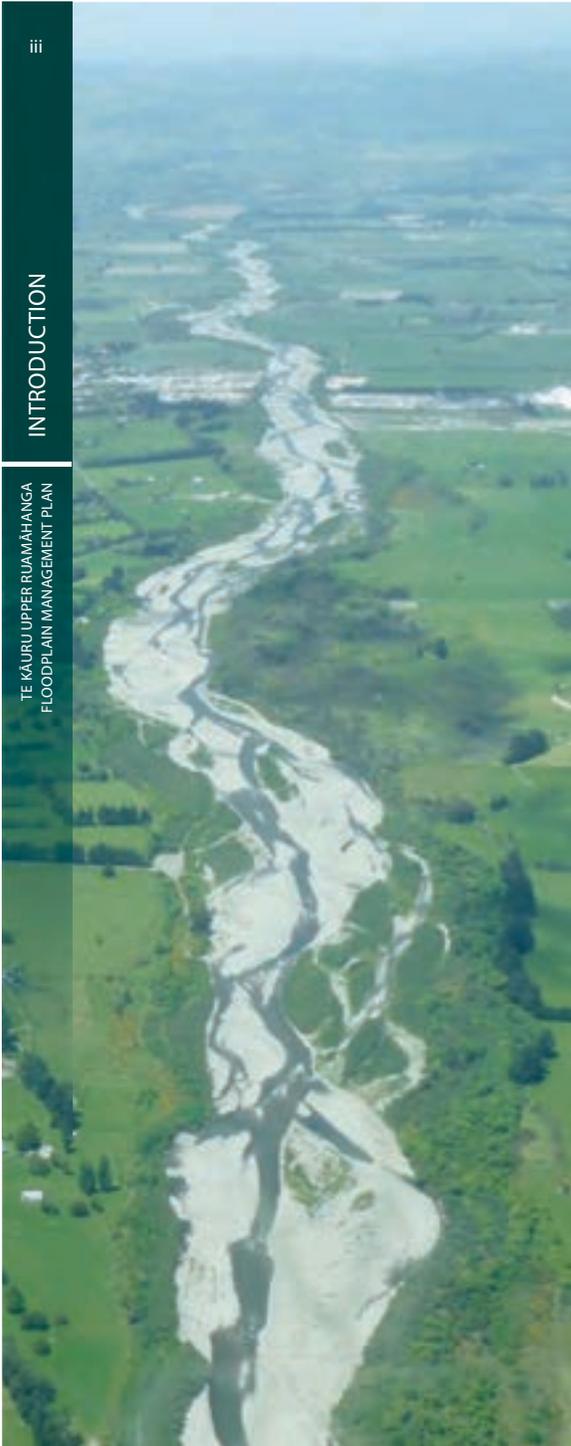

The rivers within the Te Kāuru Upper Ruamāhanga catchment have a history of flooding, causing danger and disruption for people within the catchment. The results of flooding can be devastating and cause damage to property and community assets.

This Floodplain Management Plan represents many years of investigating the most appropriate, comprehensive and long-term approach for managing the flood and erosion risks to both rural and urban land within the Te Kāuru Upper Ruamāhanga catchment. The process of preparing this Floodplain Management Plan has involved the assessment of various options that were based on a vision and set of aims developed early in the process. Importantly, the practicality, cost, environmental impact, cultural values, views/needs of the community, and legislative and policy requirements have all influenced the document.

Following several stages of consultation and engagement with the community on three draft volumes of the Floodplain Management Plan, many updates and amendments have been made. The previous three draft volumes have been combined into this single document forming the “Proposed” Floodplain Management Plan for the Te Kāuru Upper Ruamāhanga catchment. We are now seeking submissions on this document. Once adopted, this Floodplain Management Plan will be the “blueprint” for ongoing and future flood and erosion works within the Te Kāuru Upper Ruamāhanga catchment.

The primary flood and erosion response measures contained in this Floodplain Management Plan are a package of “common methods” and “reach specific responses” (both non-structural and structural) that manage the identified flood and erosion risks throughout Te Kāuru Upper Ruamāhanga. This Floodplain Management Plan has been put together by Greater Wellington Regional Council in collaboration with Carterton District Council, Masterton District Council, Ngāti Kahungunu ki Wairarapa, Rangitāne o Wairarapa, and the wider community. The Te Kāuru Upper Ruamāhanga Floodplain Management Plan Subcommittee has facilitated the development of this Flood Management Plan.

This Floodplain Management Plan will be a long-term plan and living document for the approach to flood and erosion management within the Te Kāuru Upper Ruamāhanga catchment. As such, ongoing monitoring of this Floodplain Management Plan will enable the outcomes to be regularly reviewed. Additionally, a comprehensive review of this Floodplain Management Plan will be undertaken after 20 years, or earlier if the flood hazard is significantly altered by flooding, earthquakes or new information.

Te Kāuru Upper Ruamāhanga catchment

1. What is this Floodplain Management Plan?

The Te Kāuru Upper Ruamāhanga Floodplain Management Plan (FMP) describes the long-term approach to floodplain management within the Te Kāuru Upper Ruamāhanga catchment. This encompasses the upper reaches of the Ruamāhanga River to the Waiohine confluence, and includes the Waipoua, Waingawa, Kopuaranga, Whangaehu, and Taueru (Tauweru) rivers from their headwaters within the Tararua Ranges and Eastern Hills to their confluences with the Ruamāhanga River. The catchment has a total area of approximately 1,560km².

Floodplain management planning is commonly used as an effective process to address flooding and erosion issues resulting from our rivers. It provides a long-term plan for managing risks and helping to improve the security and quality of life for present and future generations living on a floodplain. Additionally, it better prepares communities for coping with a flood when it occurs and aims to ensure that any future development considers flood and erosion risk.

FMPs are non-statutory plans and, as such, their policies and flood mitigation methods have no legal standing as regulations. Regardless, FMPs carry considerable weight in any decision-making given the public process undertaken to prepare the plans and Greater Wellington Regional Council's (GWRC) responsibility for flood protection in the region.

In accordance with GWRC guidelines, this FMP contains information about the rivers and associated tributaries, the risk of flooding and erosion, and what has been done to manage the risk so far. It also describes potential environmental, cultural, and recreational values the community holds in relation to the catchment, and how floodplain management can seek to maintain or improve these values.

Crucially, this FMP sets out the outcomes the community would like to see achieved in the floodplain, including the measures required to minimise risk in the event of a flood. As part of understanding the desired outcomes of the community in preparing this FMP, different local, regional, and national perspectives from a range of parties have been taken into account. Relevant parties have included the Regional and District Councils, iwi, government agencies, infrastructure providers, community groups, and private land and business owners – all of whom have to consider the consequences of flooding. The development process and involved parties are described in more detail in *Appendix 1* of this document.

This plan is the primary floodplain management guidance document for landowners, government agencies, the community, and decision makers to reference when considering the future planning and administration of the Te Kāuru Upper Ruamāhanga catchment. As such, this FMP has been prepared as a living, non-statutory document and it will need to be updated in the future, as required. At the time of any update, all of the interested stakeholders will be consulted to provide input into the long term management of the river catchment.

This Floodplain Management Plan is set out in two parts:

- Part 1** describes why we need this plan (including the vision and aims), the suite of responses and common methods that will be used throughout the catchment, and how the plan will be implemented.
- Part 2** sets out the floodplain management outcomes to be delivered across the Te Kāuru Upper Ruamāhanga catchment. The six rivers that make up the Te Kāuru Upper Ruamāhanga catchment have been divided into 20 separate reaches (17 for the western gravel bed reaches, as well as the three eastern silt bed rivers) for the purpose of identifying existing values and flood and erosion issues and thereby directing the most suitable floodplain management responses.

2. Why do we need this Floodplain Management Plan?

2.1 Purpose of the Floodplain Management Plan

The purpose of this FMP is to establish a framework that will assist in keeping people and property safe in the Te Kāuru Upper Ruamāhanga catchment. It will do this by proactively managing the river channels as well as providing land use and protection measures to support the continued appropriate use of both rural and urban land and resources in potential flooding and erosion prone areas. The main purpose of proactively managing flood and erosion risk to people and property is supported by some common underlying themes, including the desire to:

- Avoid risk;
- Reduce the flood risk to people and property;
- Support a resilient local economy and a scheme that is affordable and fairly funded;
- Work with district councils to coordinate long term planning outcomes;
- Recognise the role of tangata whenua and their cultural values;
- Recognise environmental matters; and
- Provide recreational opportunities.

2.2 Principles of River Management with Respect to Flood Protection

Sustainable and effective river management is based upon the following six key interrelating principles, which have been incorporated into the development of this FMP and will be incorporated into the development of Operational Management Plans (OMPs).

- Rivers are dynamic. They are constantly changing and at any time, are a physical expression of a combination of their physical, climatic and human processes (both past and present) at the catchment and reach level.
- To work with rivers and not against them. Healthy rivers are diverse rivers. Diverse rivers have greater natural character, which provides for a greater expression of mauri and their inherent aquatic and riparian habitats, which in turn support greater species diversity.
- Rivers need room to move. Rivers naturally meander, and the meander pattern will tend to migrate downstream over time. Central to this process is erosion and deposition of bed and bank material and the re-location of riparian margins.
- River management requires knowledge. Understanding catchment specific river histories and bedload transport capacities is needed to predict reach specific future state, and what is realistically achievable.
- Rivers are managed for a range of flood flows. Both maximum flood and channel carrying capacities are managed to meet the community's expectations for protection, and the avoidance and/or mitigation of flood hazards.
- River management requires adaptability. The unpredictability of dynamic rivers combined with fixed channel capacity constraints, means flexibility of management is important to achieve agreed outcomes.

2.3 Values

As with all rivers, the rivers that make up the Te Kāuru Upper Ruamāhanga catchment have a diverse range of values attributed to them. These include a range of intrinsic values encountered throughout the catchment and that influence the way humans relate to and interact with the floodplain. The emphasis of such values shifts in response to the culture of the community and may change as generations come and go.

The Resource Management Act (RMA, 1991) sets out the broad framework through which all New Zealand's rivers must be sustainably managed to provide for our social, economic and cultural well-being and to preserve natural character. Within the regional context of the rivers which make up Te Kāuru Upper Ruamāhanga, important values are managed through the Natural Resources Plan and the Ruamāhanga Whaitua process, both of which have identified values through input from the local community and tangata whenua.

Throughout the Te Kāuru Upper Ruamāhanga floodplain the specific values of rivers and their associated natural character include: providing food and resources; contributing to identity; providing for livelihood; sustaining health and wellbeing; and providing recreation opportunities. Many of the values recognised today extend back to pre-European settlement - commonly referred to as cultural values in the development of floodplain management plans.

Te Kāuru – the headwaters of the Ruamāhanga catchment – extends from the Tararua Ranges to the Eastern Hills covering an area of 1,560km². The western rivers, with their gravel beds, emerge from the rugged Tararua Ranges, well known for their pristine native forests, onto the fertile Wairarapa Plains. As a result, the upper reaches of these rivers are commonly valued for their beauty, mauri (life force), recreational opportunities and spiritual significance. The eastern rivers, with their silty beds, are characterised by lower undulating hills dominated by agricultural use. However, strong cultural and ecological values remain alongside several recreational areas.

Through the FMP process, specific sites of value have also been identified across the Te Kāuru Upper Ruamāhanga floodplain. These are shown on a series of maps in Part 2 of this FMP and encapsulate the following:

Landscape

Each river has been divided into defined reaches, recognising the unique identity each section of river has in terms of river attributes, landscape context and riparian margins. Recognition of landscape value has been informed through landscape character investigations developed to inform the Regional Plan and includes a refined understanding of the level of landscape modification and scenic value for each reach.

Recreational

All of the rivers in the Te Kāuru Upper Ruamāhanga catchment are recognised as having at least some level of recreation value, reflecting the way in which the rivers are used by groups and individuals for pastimes, hobbies or recreation. Such recreation activities include swimming, kayaking, fishing, duck hunting, jet boating and walking and encompass recreation areas established along river margins.

Heritage

The Ruamāhanga River and its tributaries have played an important role in shaping the historic settlement pattern that has evolved within the Wairarapa Valley. Early settlement historically focussed along the margins of the river, and sites of heritage value remain along parts of the Te Kāuru Upper Ruamāhanga floodplain.

Cultural

Ngati Kahungunu ki Wairarapa and Rangitāne o Wairarapa have a close relationship with the rivers, wetlands and floodplains throughout Te Kāuru. This includes sites of specific importance and broader, more holistic cultural values. An on-going partnership between GWRC, MDC, CDC and iwi has been established to ensure better understanding of the range of spatial and non-spatial cultural values which occur.

Land use

Land use values include a range of current and future land-uses relevant to both urban and rural contexts. This includes future development sites, key infrastructure, and sites of potential contamination included in the Selected Land Use Register.

Ecology

Te Kāuru Upper Ruamāhanga is valued for its broad ecological diversity. This includes native and introduced fish species and a range of bird species including several ground nesting species such as the nationally-threatened Buller's Gull. Apart from a more cohesive cover of native vegetation established in the upper reaches of the western rivers, vegetation along the margins of the rivers is dominated by willows with pockets of important habitat, indigenous forest, stonefield and boulderfield, natural wetlands and ponds.

2.4 Vision

The range of values recognised throughout Te Kāuru Upper Ruamāhanga forms a primary focus that has shaped and guided the overall vision for this FMP. Key values encapsulated in this vision include: promoting sustainable economic development; protecting and enhancing natural spaces and systems; recognising and improving tangata whenua values; and providing for wider community needs, including building resilient communities. To achieve this vision, the FMP requires people and communities to work together.

The overarching floodplain management vision for the Te Kāuru Upper Ruamāhanga catchment is to establish:

A CONNECTED, RESILIENT, PROSPEROUS AND SUSTAINABLE COMMUNITY, PROUD OF ITS RIVERS, THAT IS INVOLVED IN MANAGING FLOOD RISKS IN A MANNER THAT RECOGNISES LOCAL IDENTITY AND PROTECTS, ENHANCES OR RESTORES NATURAL AND CULTURAL VALUE

The vision of the Te Kāuru Upper Ruamāhanga FMP is aligned with the expected outcomes stated in the Long-Term Plans of the regional and district councils as shown on the following diagram.

TE KĀURU UPPER RUAMĀHANGA FMP VISION:

A connected, resilient, prosperous and sustainable community, proud of its rivers, that is involved in managing flood risks in a manner that recognises local identity and protects, enhances or restores natural and cultural value

Masterton District Council LTP:

- a strong, resilient economy
- a sustainable, healthy environment
- an active, involved and caring community - recreation
- a reliable and well-maintained infrastructure

Carterton District Council LTP:

- a vibrant and prosperous economy
- a safe and healthy district
- a district that enjoys recreation
- a district that values and protects its natural environment
- a district that promotes sustainable infrastructure and services

Greater Wellington Regional Council LTP:

- a resilient community
- a strong economy
- a healthy environment
- recreational use of river corridors

2.5 Aims

Through the development of this FMP, overarching aims were identified to describe the desired outcomes to be achieved through the FMP. More detailed management objectives for each reach or that may be required for specific sites are also included on a reach-by-reach basis in Part 2.

In identifying the overarching aims of this FMP, inspiration was drawn from a range of different sources, including council policies, mission and purpose statements of organisations involved with the FMP, and the issues and values held by affected communities.

While the aims have been split into five groups, a complex relationship exists across the groups and between individual aims. No prioritisation is implied by the numbering of the aims, which has been used purely to assist discussion.

1. To work together to develop a sustainable floodplain management plan

- a. Provide affordable flood hazard management across a whole continuum of flood risk
- b. Align with integrated catchment management principles
- c. Follow the principles set out in the flood protection Code of Practice
- d. Endeavour to make future development and land-use compatible with flood risk

2. To support sustainable economic development

- a. Inform the long term plans of local authorities
- b. Reduce the likelihood of loss to private property, business and agriculture
- c. Make property owners aware of their flood risks and damage potential
- d. Manage or reduce the risk to essential public infrastructure and maintain lifelines during flood events.

3. To protect and improve the cultural values of rivers

- a. Improve the recognition of the impacts of flood and flood hazard management on cultural activities and values
- b. Improve the mauri of waterways within the catchment
- c. Improve access for mahinga kai and cultural practices
- d. Recognise and consider the interconnectedness of natural systems

4. To recognise local community needs and build resilient communities

- a. Make communities aware of their flood and erosion risk
- b. Recognise opportunities to support the sustainable aspirations of the community and landowners
- c. Identify and support opportunities for improved public access to and along rivers
- d. Maintain and improve the level of safety for recreation users of the rivers

5. To protect and enhance our natural spaces

- a. Improve awareness and understanding of the natural values and character of the river environment
- b. Improve recognition of impacts of flood and flood hazard management on environmental and ecological values
- c. Create more space for rivers and their natural processes
- d. Improve the water quality and habitat diversity along the rivers
- e. Make the use or extraction of natural resources including gravel management sustainable and compliant with relevant policies.

2.6 Legislation, Policies and Principles

Decisions concerning the management of flood risk, such as that associated with the Te Kāuru Upper Ruamāhanga catchment, are informed by a mix of national and regional statutes, policies, and principles that underlie, and set the context for, effective floodplain management planning.

At a legislative level, floodplain management is principally influenced by four key statutes: the Resource Management Act 1991 (RMA); the Local Government Act 2002 (LGA); the Soil Conservation and Rivers Control Act 1941 (SCRCA) and the Local Government (Rating) Act (2002). Each of these perform a distinct and important role in managing flood risk, including the ability for a range of regulatory and non-regulatory measures to be introduced that enable central and local government to more effectively manage such risks. Provisions in the RMA, for example, provide a regulatory planning context for regional and city/district councils to control land use to avoid or mitigate natural hazards such as flooding, while the LGA and SCRCA enable regional councils to initiate and fund non-regulatory measures, such as stopbank construction and channel maintenance.

At a national level, the National Policy Statement for Freshwater Management (NPS-FM, 2014 (Amended 2017)) provides direction to local authorities on management of fresh water through establishment of a framework that considers and recognises Te Mana o te Wai (the integrated and holistic well-being of the water) as an integral part of freshwater management. In addition, it also includes a set of objectives and policies that direct that water to be managed in an integrated and sustainable way, with provision made for economic growth within set water quality and quantity limits.

At a policy level, the Regional Policy Statement for the Wellington Region (RPS) plays a prominent role in managing natural hazards, such as river flooding. The RPS does this through the policy framework it establishes for the region and that the regional council and district councils are required to give effect to in their respective regional and district plans. Of particular note is the directive in Policy 29 of the RPS that district and regional plans 'avoid subdivision and inappropriate development in areas at high risk from natural hazards'.

GWRC has adopted four core principles that underpin its approach to floodplain management planning, and that reinforce and complement the statutory and policy considerations outlined above. These principles are:

- Avoid building in areas at high risk of flood hazard (e.g. undeveloped 'greenfield' areas)
- Only consider new flood protection infrastructure where existing development is at risk (e.g. dwellings, irrigation infrastructure, dairy sheds)
- Establish standards of flood protection relative to the degree of risk (e.g. a minimum 1% Annual Exceedance Probability (AEP) flood standard for stopbanks constructed to protect existing urban areas and associated land-use)
- Plan for climate change in assessing the degree of flood hazard risk and in determining an appropriate response (e.g. a 0.8m allowance for sea level rise)

These principles played an influential role in informing the range of responses included within the Te Kāuru Upper Ruamāhanga FMP.

Further supplementary detail relating to the core principles is included in *Appendix 4*.

2.7 Ruamāhanga Whaitua

The Ruamāhanga Whaitua Committee was established to recommend ways to maintain and improve the quality of our fresh water. The committee was asked by Greater Wellington Regional Council to make recommendations on how to implement the National Policy Statement for Freshwater Management (NPS-FM) in the Ruamāhanga Whaitua area. In August of 2018, the Whaitua Implementation Plan (WIP) was finalised and has now been approved by Greater Wellington Regional Council. The WIP will be integrated into the proposed Natural Resources Plan over the next few years. Te Kāuru recognises that the WIP will have an influence over how flood protection is undertaken now and into the future and how these works can assist in achieving the objectives of the WIP.

The WIP has outlined the following objectives to meet the NPS-FM:

- Mauri, natural form and character and habitat objectives;
- Fish and mahinga kai objectives;
- Sediment objectives; and
- Water quality, algae and invertebrate freshwater objectives for rivers and lakes;

Staff will continue to work across the organisation and with the community to ensure all objectives are optimised.

HOW THE TE KĀURU FMP AND WHAITUA FIT TOGETHER

2.8 Flood History

There has been a long history of river management within the Te Kāuru Upper Ruamāhanga catchment associated with human settlement and the desire of people to protect themselves and their assets from the threat of flooding. Floods that breached the river banks and flowed across the Te Kāuru Upper Ruamāhanga floodplain occurred relatively frequently, especially in the eastern areas of the catchment.

For early Māori, and later the first European settlers, settlements existed through the establishment of seasonal sites. The timing of these would be driven by a range of factors including flood risk, and their location governed by proximity to important and lucrative resources that were often very close to rivers. These sites provided easier transport links, and improved access to water, food, and fertile land and eventually led to permanent settlements.

Following the arrival of Europeans, some of these settlement sites have grown into large permanent towns. The increased size has put them in a position where some parts of the community have spread out into areas of greater hazard. This, combined with changing environmental conditions, can lead to increased conflict between the flood hazard and community aspirations, and if left unchecked results in an increasing risk to life and property.

The Ruamāhanga River is well known to the Wairarapa community for its flood events. During the early 20th century, settlers suffered damage and loss when the Ruamāhanga River overflowed its banks, washing shingle onto valuable pastures. The bed of the river had become badly choked with willows, restricting flood flows, and the channel was of inadequate size for the floodwater volumes and of irregular alignment.

One of the most destructive flood events in the Wairarapa valley took place in 1947. During this event, the flow in the Ruamāhanga River measured 2,580m³/s near Martinborough and was estimated to be a 1% AEP flood event (meaning that there was a 1% chance of this event occurring in any year). The most significant impacts from this event were experienced in the lower reaches of the Ruamāhanga catchment, but floodwaters entered Masterton and other Wairarapa towns, and most of the stopbanks on the Ruamāhanga River were overtopped. This resulted in thousands of acres of farm land being flooded and thousands of drowned livestock. Individual property damages were also significant.

In response to the ongoing risk of flooding, various river management schemes were proposed and implemented to provide river alignment stabilisation, bank edge protection, and improved stopbanking to reduce the incidence of flooding to adjacent floodplain along many sections of the river.

The major flood risk to Masterton comes from the Waipoua River. Additionally, the flood risk from the Waipoua River can be compounded by the backing up effects of flooding in the Ruamāhanga River. Because of this, the Waipoua River was substantially modified and straightened in the 1930s and 1940s, including establishing the existing stopbanks constructed along the margins in response to flooding concerns.

The rivers of the Upper Wairarapa Valley are also connected and can be influenced by the same rainfall event, so when one rises the others can follow. This can increase the risk of flooding and lead to serious events that can cause significant levels of property damage. One example of this, largely within the rural areas, was during the 1998 which caused damage to a large number of private properties and flood protection infrastructure.

Flooding of Bruce Street 1934

The Waingawa River is a steep and powerful river. Fortunately for much of the surrounding community, the river is entrenched within a fairly tight, naturally-confined floodplain. This means that much of the flooding – even in a large flood event – is contained by the river terraces from where it enters the Wairarapa Plains until it joins the Ruamāhanga River. Within these confining terraces, recent river activity can clearly be seen on the ground and more clearly in aerial photography where overflow paths have left their mark both from deposition and scour. While the flood risk from the Waingawa River is limited by its entrenched form, the erosion risk, both modelled and observed, is of significance. This high energy river regularly reshapes its main channel during each flood event.

Historically, the Whangaehu River has caused issues with extensive flooding across the Wairarapa Plains. During the 1960s and 1970s, river management techniques of straightening the river and intensive willow planting were carried out to manage flooding hazards. Unfortunately, these willows eventually led to significant erosion issues after the river channel became 'choked' with vegetation, resulting in the river channel migrating to adjoining areas. This then led to issues with sedimentation causing further channel constrictions.

A number of significant flood events have also occurred in the Taueru River. Similar to the Whangaehu River, willow trees were planted along the length of the Taueru River and have resulted in channel constrictions. A river management scheme was established in 1994 in the lower reaches of the river to address flooding issues.

In 2004 and 2005, extensive flooding occurred on the Kopuaranga River that consequently led to the formation of a river management scheme. As with the Taueru and Whangaehu Rivers, the scheme's work was mainly focused on managing the impacts of flooding related to willows choking river flows in the channel.

2.9 Future Flooding and Climate Change

While climate modelling and historical data can provide some insight into how natural cycles and climate change will interact, the underlying science continues to evolve. Scientific understanding and/or national guidance may mean future changes for this policy.

2.9.1 Climate Change

International and national agencies predict that climate change will have an effect on river hydrology. Weather patterns are expected to become more erratic: with an increased number of droughts followed by storms of heightened intensity. While these predictions are varied in magnitude, GWRC has utilised a Ministry for the Environment guidance which indicates a 1% AEP rainfall in the Upper Ruamāhanga to be 20% greater by 2100 and this allowance has been used in its modelled flood maps and planning for flood risk management.

NIWA predicts that potential climate change implications for the Upper Ruamāhanga may include:

- An increased number of droughts followed by storms of greater rainfall intensity;
- Spring rainfall reduced by up to 15% and winter/autumn rainfall increases;
- Decreased total volume of precipitation received by the upper Ruamāhanga catchment;
- Changes in both high flows and low flows toward more extreme values;
- Increased frequency of high flows; and
- Increased short duration storm intensity with little change in longer duration storm intensity.

2.9.2 Climate Cycles

Short and long term climate cycles through natural fluctuations such as El Niño- Southern Oscillation (ENSO) and Interdecadal Pacific Oscillations (IPO) also have an impact on climate and river hydrology.

- ENSO cycles, commonly known as El Niño and La Niña, are short term, irregular phase changes in the Pacific Ocean that affect rainfall patterns and trade winds. Geographically diverse regions of New Zealand (including within the Wellington region) are affected differently by these cycles. For example, the Wairarapa tends to have a drier than normal climate in El Niño phases and a wetter climate in La Niña phases.
- IPOs are large scale, long period cycle operating at a multi-decade return that cause a fluctuation in atmospheric pressure and sea surface temperatures. IPOs also appear to modulate the impacts of inter-annual ENSO climate variability over New Zealand. Typically, high sea surface temperatures have been observed during negative IPO phases - leading to higher than normal rainfall conditions in the greater Wairarapa region; and low temperatures during positive IPO phases lead to drier than normal conditions.

As of 2018, the IPO appears to be approaching the middle of a negative phase, indicating an overall wetter period is likely for the Upper Ruamāhanga catchment.

- There is currently no scientific consensus on how climate change may affect ENSO and IPO cycles. However, climate change is likely to increase the frequency and intensity of extreme weather events, regardless of whether they are associated with ENSO or IPO.
- ENSO and IPO cycles represent climate variability on large time scales and may not represent a particular yearly climate.

2.9.3 More Information

More information on the different aspects of climate change can be found at the following websites:

- El Niño and La Niña - <https://www.niwa.co.nz/climate/information-and-resources/elniño>
- Interdecadal Pacific Oscillation - <https://www.niwa.co.nz/node/111124>
- Ministry for the Environment Climate Change – <http://www.climatechange.govt.nz>
- GWRC Climate Change - <http://www.gw.govt.nz/climate-change/>

2.10 Why Change? Drivers and Benefits

The key river management drivers of this FMP include:

- Continued provision of flood hazard management and erosion protection for land beyond the buffers (using sustainable management approaches);
- More equitable distribution of scheme resources; and
- Enhancing environmental and cultural values of the rivers by allowing greater expression of natural river processes, where possible, and attempting to minimise the frequency of in stream works.

This FMP sets out the methods to achieve the vision and aims.

The methods seek to bring a range of benefits as outlined below.

- Equity and social benefit - River scheme benefits will be more equitably distributed. In the current situation, some landowners receive the highest level of scheme expenditure (e.g. when a landowner does not provide the space for buffers). Reactive works will no longer be automatically directed towards properties where buffers have not been provided to control erosion, thereby addressing the potential for ongoing unequal cost burdens to other landowners presently within the scheme.
- Increased environmental value of the rivers – The methods ensure that ecosystems and biodiversity have the opportunity to improve. For example, providing more space for the river channel can result in more diverse aquatic and riparian habitat and better connectivity between terrestrial and aquatic ecosystems. A more naturally meandering river creates more variety of flow velocities, depths, and temperature. This also supports greater habitat diversity than is generally available in more restricted or highly managed river channels and provides opportunities for diversity of riparian plants, which provide increased food and shelter for terrestrial ecosystems. These outcomes will work to improve natural character and conditions which provide for more variety in aquatic life.
- Increased cultural value – This embodies kaitiakitanga (guardianship of, and caring for, the river) by considering the processes on the catchment scale, allowing the rivers to express more of their natural character, behaviour and form. These also enhance a river's mana.
- Economic opportunities – Potential economic opportunities can occur in association with changes in land uses along river corridors. Vegetated buffers may increase productivity in some instances. The honey industry also sees opportunities associated with vegetated buffers that produce food for bees.
- Improved recreational and amenity value – It is anticipated that improved natural character will support more birds and fish, and improved water quality will enhance recreational opportunities within and along the margins of rivers.

The most significant changes to river management in the Te Kāuru catchment are to plant the buffers and to give the river more room. This approach is in line with the Resource Management Act (RMA) 1991; the proposed Natural Resources Plan; the Ruamāhanga Whaitua's Whaitua Implementation Programme (WIP), as well as other national and regional policies. As outlined in Section 2.9, climate change is another driver for change. A background report regarding "Buffer Management – Benefits and Risks" by Professor Russell Death (2018) is available on request.

Changes are occurring internationally as well. The Netherlands is establishing programmes to give the river more capacity. It believes that by giving the river more room, there will be more room available for higher water levels and flood damage will be reduced. Countries such as Russia, Switzerland, Finland, Sweden, Norway, Estonia, and Denmark, for example, are undertaking river restoration works for flood protection as well as for habitat enhancement. For more information on the work being undertaken internationally, please see the following link: <https://restorerivers.eu/>

There are various programmes within Greater Wellington Regional Council that support the natural character of rivers and riparian vegetation. The Land Management team have a riparian programme and the biodiversity team have a restoration planting programme, as examples.

There are also a number of external initiatives such as:

- Dairy NZ waterway management programmes;
- Department of Conservation and Fonterra - living water;
- Ministry for the Environment – Our Fresh Water 2017;
- Waikato Region – Healthy rivers programme;
- Taranaki Regional Council – Planted riparian zones; and
- 1 Billion Trees.

2.11 Risks and Constraints

A number of risks associated with the change are acknowledged.

- There is a risk that monitoring and then intervening later will cost more and may be more intense for the river environment compared with more frequent, smaller interventions. The size and nature of this depends on future natural processes in the catchment which are difficult to predict.
- It is also recognised that the prospect of losing current productive land uses within the existing buffer may not be supported by all landowners.
- Environmental risks include potential increase of pest animals and plants, such as old man's beard, within larger planted buffers.

There were also several key constraints that had to be considered when assessing management options, including:

- The location of existing assets (such as bridges, roads, houses); and
- Balancing the environmental and cultural values of allowing the river flexibility to behave more naturally with the economic costs of the potential loss of productive land.

Consequently, the outcome of this FMP will be a change in the manner in which river management lines are implemented and the way river works are managed, in order to maximise natural river processes and enhance the environment, while providing the agreed level of flood and erosion protection. This follows the vision and aims of this FMP to protect, enhance and restore natural and cultural values while supporting sustainable economic development and resilient communities.

3. Responses and Common Methods

Due to the large area this FMP covers and the varying types of land-uses and types of rivers within this catchment, a combination of different flood and erosion management responses has been developed.

There are two distinct types of river management schemes operating within the Te Kāuru Upper Ruamāhanga catchment, which reflect the different natures of the rivers. Schemes covering the western side of the valley are dealing with larger, gravel bedded rivers (the Waingawa, Waipoua and Ruamāhanga Rivers) which are managed within existing river management envelopes (see Section 3.2.2 for more detail). Schemes established on the eastern side include the Kopuaranga, Whangaehu and Taueru Rivers which are smaller, silt bedded rivers coming from the Eastern Hills and do not have river management envelopes. Different management regimes are required for the gravel bed and silt bed rivers. The 2019 management practices are discussed in *Appendix 2*, and responses are in Part 2.

This section outlines the ‘common methods’ employed for selective use throughout the Te Kāuru Upper Ruamāhanga catchment. Some common methods apply across the whole area of the Te Kāuru Upper Ruamāhanga catchment, while others are more specific to a particular type of river management regime that only applies to some reaches. In this context, common methods inform the physical interventions undertaken through river management activities.

In particular, this FMP outlines a river management approach that seeks to allow the rivers to behave more naturally, with less frequent intervention, within the current envelopes. This is an explicit attempt to strike a balance between improving the river environments and recognising the economic value of the adjacent land (and the views of the landowners).

Where specific responses are required to address more complex or location-specific issues, these are identified in Part 2 of the FMP on a reach-by-reach basis. Such responses include further details which set out how and where they apply. In some cases, the responses include exceptions to the common methods and may include project specific measures to address a particular flood or erosion issue. Major Project Responses have been developed in locations where the issues cannot be managed by normal application of the common methods alone.

The set of response types which have been developed to implement this FMP have been categorised into the following five groups described below:

Structural

River Management

Planning and Policy

Emergency Management

Environmental Enhancement

3.1 Structural Responses

Structural responses encompass the development of structures and other physical works designed to keep flood waters away from existing development. Stopbanks and floodwalls are obvious examples of structural works that are typically designed to a specific flood standard, e.g. 1% AEP. Structural responses typically require ongoing bank edge works and channel management to ensure flood defence structures and physical works remain effective. Within the Te Kāuru Upper Ruamāhanga catchment, rock lines, riparian planted buffers and groynes are all employed to protect flood defences like stopbanks and maintain the channel’s position.

New structural methods, such as stopbanks, are not included in the common methods as they are part of a site-specific response.

3.2 River Management Responses

River Management responses guide GWRC's ongoing physical interventions in the river environment, and as such they are the "sharp end" of this FMP for many people and groups who have an interest in the river environment. 'River management' refers to works within the bed of the river or on the river berms. All river management works must be undertaken in accordance with GWRC's 'River Management Code of Practice'.

Common methods that apply this type of response will be employed by the Flood Protection Operations team through Operational Management Plans (OMPs). Such plans look five to ten years ahead and are developed to be consistent with the directions given in this FMP. The OMPs will set out, reach by reach, the detailed works and priorities for upcoming annual work programmes. The OMPs may need to be revised to take into account damage following flood events. The annual works programme and plans will provide the detail of exactly what and where different activities will be carried out on an annual basis.

River management common methods (outlined in Sections 3.2.1 to 3.2.11) reflect community desires to allow space and freedom for the river to behave more naturally while providing a degree of certainty and protection to neighbouring landowners. This will be achieved for example, by:

- Using envelopes in the western rivers as a management method rather than holding the river to a fixed line (either in its alignment or in the bed levels) (Section 3.2.1 and 3.2.2), allowing the natural processes of bed scour/deposition and bank erosion/accretion associated with meander migration to take place;
- Using riparian planting of buffers within the western rivers and vegetated edge protection within the eastern rivers as the preferred edge protection method and allowing buffers to be subjected to natural river process (i.e. flexible buffers) (Section 3.2.2, 3.2.3 and 3.2.5); and/or
- Minimising the frequency of interventions in the channel. Where intervention is necessary to maintain a clear fairway and buffer, various good management practices will be used.

The expected outcome is that the river is able to behave in a more natural way with a greater variety of form and habitat as a result. Although it is also intended that GWRC will be required to intervene less frequently in the western river channels with mechanical means, the overall scale of works will not necessarily be less. This FMP acknowledges that active intervention with machinery in the river environment will still be needed. In some cases, for example to re-establish vegetated buffers following major damage, this intervention will be significant. In other locations, regular work with machinery may still be the best way to achieve the overall outcomes of this FMP where other methods are not effective. Through this FMP and the OMPs, alternatives will be considered, and mechanical intervention will be avoided if a better alternative exists (including taking all values described in Section 2.3 above into account).

This FMP and the OMPs seek to strike a balance between the different values in each reach and the benefits of allowing the river to behave more naturally versus the benefits of controlling the river's behaviour to manage flooding and erosion problems (e.g. protect people, properties and productive land). Decisions on which river management common methods to use and how and where to apply them will be made in an open way through the direction given by this FMP, and the direction provided through the OMPs and Code of Practice (described in Section 3.2.1).

The first consideration when assessing any response should be to ask the question: "can we avoid doing work here?"

Interventions to move any of the western rivers out of the buffer will generally take place only when:

- The historical channel lines indicate an unusually high risk to adjacent land if the river should erode further; or
- The erosion is continuing further landward with no signs of migrating downstream (i.e. a considerable "hook" is developing which threatens to result in a major realignment of the river); or
- The erosion has occurred and worsened through a series of minor events, giving concern that the land behind the buffer would be threatened by ongoing erosion in further minor events; or
- There is a threat to public infrastructure.

Exceptional circumstances may arise but the OMPs are expected to follow these principles.

To assist with decision making, a hierarchy of intervention is being developed. The general concept is that where there is erosion risk to land within the buffer, the scale and type of works used would be limited to those which result in a low risk of adverse impact. As the risk presented by a particular situation increases and therefore the associated potential impacts, then the range of activities available for intervention also increases to include activities assessed as having medium and high risks of adverse impacts (explained in the table overleaf).

HIERARCHY OF INTERVENTION FOR THE WESTERN RIVERS

	SITUATION	INTERVENTION TYPE	USE OF ACTIVITIES	TIMEFRAME FOR COMPLETION
LOW RISK	Land within buffer is at risk of erosion	Limited intervention / monitoring of risk by staff	Only able to use activities which will result in a low risk of adverse impacts (this will have the effect of limiting work in the wetted channel or in high value riparian areas)	Scheduled regular maintenance (annual work programmes)
MEDIUM RISK	The outer management line is at risk from erosion	Moderate priority intervention	Only able to use activities which will result in low and/or medium risk of adverse impacts, or a limited quantum of high impact activities.	Incorporated within annual work programmes
HIGH RISK	Risk to life Risk of damage to key infrastructure Erosion has occurred beyond the outer management line	Immediate intervention	All activities available – with low, medium and high adverse impacts	Urgent – to be completed ahead of programmed work which may be practically deferred to allow for completion of priority, reactive work

This process provides an effective way of aligning the risks that the situation presents with the potential adverse impacts associated with the intervention. In effect, this will mean that low risk situations, such as minor erosion of land within a buffer where there is no critical infrastructure, can only be managed with activities that are not undertaken in the wetted channel. At the other end of the scale if there is a high-risk situation, such as breaching of the outer management line or immediate risk to critical infrastructure, then all of the activities are available including those undertaken in the wetted channel. In further developing this guidance, there will be recognition of the need to maintain a degree of flexibility to deal with different situations that may arise – while still providing enough direction to ensure a high degree of consistency and achievement of the agreed outcomes.

3.2.1 Code of Practice

The Code of Practice guides all river management activities undertaken by GWRC for the purposes of flood and erosion protection across the Wellington Region, irrespective of funding, location or whether an activity requires resource consent. This means it applies to permitted activities as well as those activities for which resource consent is required by the regional plan.

The Code of Practice aims to achieve:

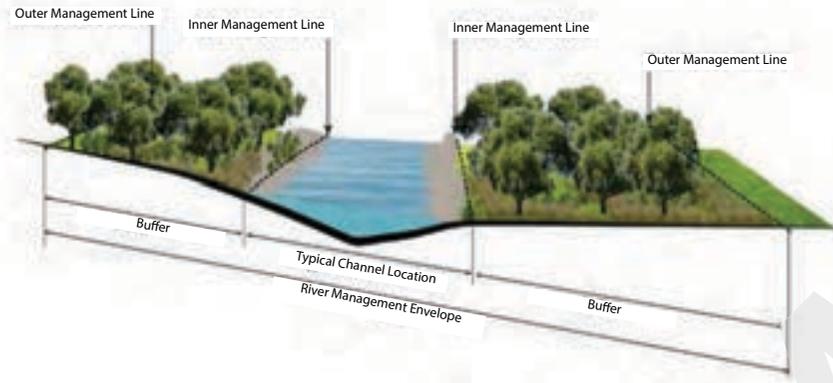

- Greater awareness of the effect of river management decisions and activities on a river's natural character and other significant river values, at both broad (whole of river) scale and detailed (reach or specific site) scale;
- Greater consistency of river management practice across the rivers that GWRC administers and manages;
- Good management of the environmental and cultural impacts of river management activities; and
- Adaptive river management practice to improve environmental outcomes.

While consideration of individual catchments has fed into the development of the Code of Practice, it is not intended to determine the best method or activity to use at a catchment, river or reach scale. It provides direction on the detail of how different river management activities are carried out on the ground.

This FMP gives direction on where and how the common methods are applied in specific reaches together with an understanding of the identified values to be taken into account. The OMPs must be consistent with these directions and users of the Code of Practice will need to note these directions or restrictions when planning which activities to use (and how/when/where to use them).

This FMP identifies values that should be managed in certain locations or certain constraints that should apply in choosing the river management activities. However, this is not exhaustive and other constraints will apply in different places and at different times. GWRC staff will consider the values at a given location together with the direction in the FMP/OMP when planning annual work programmes. The activities will need to be carried out in accordance with the Code of Practice.

Put simply, this FMP and subsequent OMPs direct which common methods are applicable within each river and/or reach. The decision to implement the available common methods in accordance with the Code of Practice is made by GWRC staff.

3.2.2 River Management Envelopes

River management envelopes define the lateral extent within which the river will be managed. River management envelopes are only used within the western rivers. An 'outer management line' defines the extent that may be eroded in small to moderate floods and/or will be used for riparian planting purposes. The space between the banks of the river and the outer management line is also known as a 'buffer'. GWRC will seek to manage the envelope so that the land outside is protected to around a 5% AEP level of service (a flood that has a 5% chance of happening every year), or in normal flooding circumstances.

These river management envelopes (also known as design lines) have been in place since the early 1990s. They were established to support good river management practice and also to give a level of confidence and clarity to adjacent landowners as to the maximum lateral extent the active river channel will be managed.

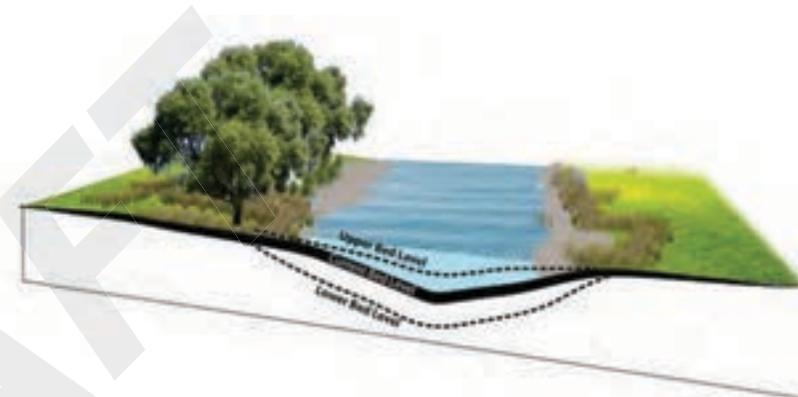

The inner management lines indicate the area where the active river channel is most of the time and the outer management lines indicate the outermost extent to which the river will be managed, thereby giving the river room to move within the buffer.

Landowners make an important contribution to flood and erosion security and ecological benefit by making land available for protection of their own and the community's assets and for allowing natural river behaviour. This contribution is addressed by the approach to strategic land purchase described in Section 3.3.8 of this FMP.

Allowing the river more room will enable the river to adopt a more natural form, which will present less risk of high flows breaching the wider river corridor into people's homes and farms. Wider channels put less pressure on banks, so the buffers are likely to be retained. We are, however, aware that there will be a tendency for lateral shift, which will need to be monitored closely.

Giving the river more room will allow it to have natural resisting elements such as bed armour, vegetation and bar forms. Once these elements are in place erosion rates should decrease.

Also, reducing the channelised floodways within some reaches of Te Kāuru will remove the rapid flow of nutrients and other contaminants, therefore reducing their discharge into the coastal marine ecosystems.

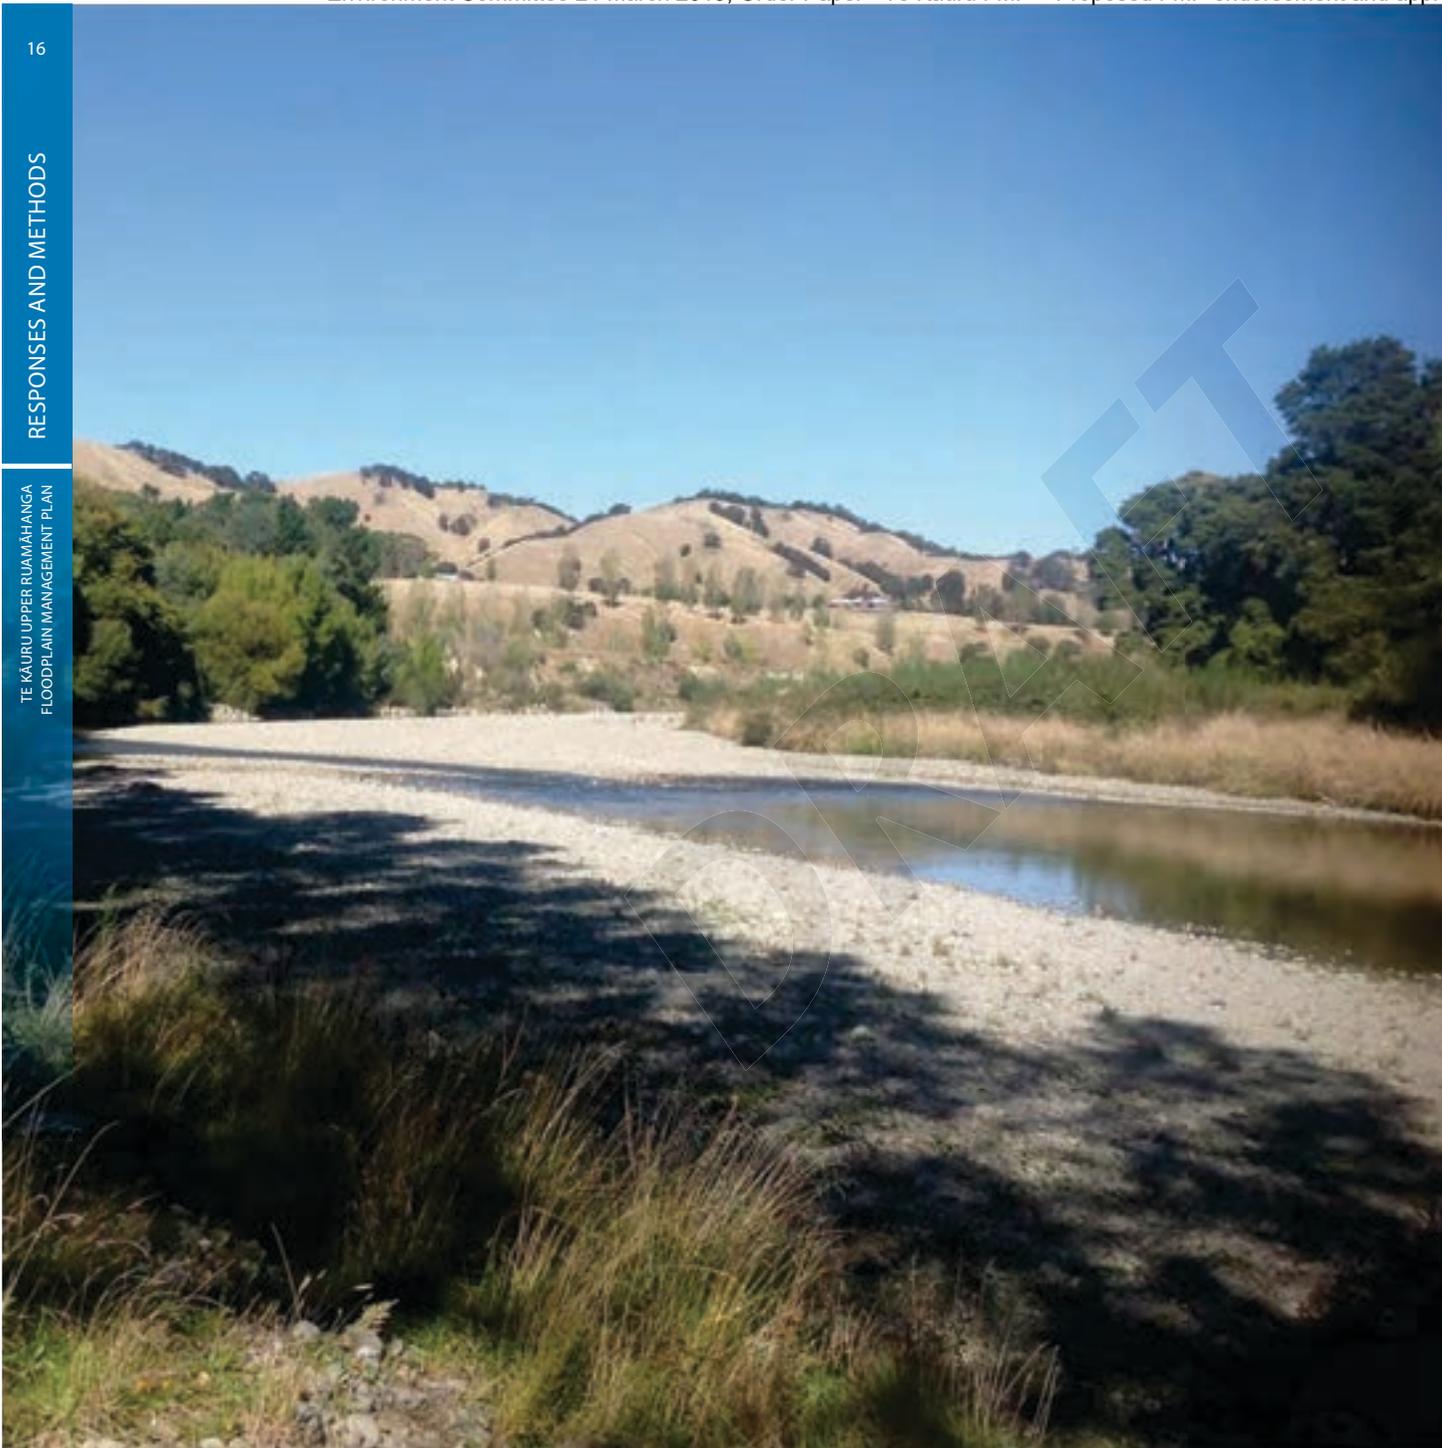

3.2.3 River Bed Level Monitoring

The bed of a river can rise (aggrade) and fall (degrade) over a period of time, and over a longer period of time can fluctuate between these two states. This happens due to natural events but can also be significantly affected by human activities. This process is particularly evident within a gravel bed river (western rivers), where rising and falling bed levels can be observed during a relatively short timeframe.

GWRC has an extensive network of cross-sections on all the main rivers in the region and these have been surveyed since the 1990s. Over time, and with more information, longer term rising and falling trends can be recorded to better understand the processes of sediment movement and be used to inform those in the community who are particularly interested in the effect of river bed levels and their close connection to the ground water table.

With sufficient data collected over time, it will be possible to establish river bed envelopes that will include limits for the upper and lower envelope. These envelope limits will be used to identify problems starting to occur so that GWRC can assess the area and determine a response. The actions triggered by these limits may include, for example, a gravel extraction response, a review of the river management envelopes or prioritisation of other management methods in the reach.

Using river bed envelopes and monitoring of long-term rising and falling trends will allow GWRC to make decisions ahead of time regarding when current river management approaches may need to change and how they might change.

3.2.4 Gravel Extraction and Analysis

Gravel extraction is one of the tools used by GWRC to manage the gravel within the western rivers. Various monitoring is undertaken (see sections 3.2.3 “river bed level monitoring” and 3.2.8 “pool, riffle, run envelope”).

One of GWRCs key objectives for gravel extraction is to use it as a means to maintain the capacity of a river to hold water within its banks as well as to manage problem beaches and channel alignment. However, there are negative effects of extraction including; reduced water quality, impacts on fish and wildlife habitat, increased lateral bank erosion and the undermining of assets such as bridges, rock structures, stopbanks and vegetative buffers. Therefore, GWRC tries to extract gravel sustainably, that is, extracting gravel at a rate that matches the gravel supply. This way the capacity of the channel can be maintained while avoiding the negative impacts of over extraction.

A common theme for rivers in the Wellington region is for aggradation in the flat lower reaches of the river and degradation in the steep higher reaches of the river. This means that GWRC is usually aiming to encourage extraction in the downstream reaches, however, the quality of the gravel downstream is not as desirable to contractors as the gravel further upstream. This provides a continual issue of managing supply and demand. GWRC need to keep contractors interested in extracting the resource as many have the option to abandon river extraction for dry extraction.

Contractors are licensed or may obtain a licence to extract under the existing GWRC river management/operations consents. This will continue with the proposed new global consent for the GWRC’s Wairarapa operations. The licences allow GWRC to monitor as well as regulate extraction locations and quantities. This is important information to monitor and record as it is vital in carrying out appropriate gravel analyses. Individuals can extract 15m³ per 12 month period for personal use and riverside landowners can extract 50m³ per 12 month period as per R120 of the proposed Natural Resources Plan.

A gravel analysis process is used to establish the locations and gravel quantities required to be extracted. Following on from each gravel analysis a series of recommendations are made to reflect the latest findings in gravel trends. Recommendations may require GWRC to increase, decrease, cease or maintain the current rate of extraction. It may also aim to focus extraction in different areas of the river.

Gravel analysis requires river surveys, which GWRC has set up for all the major rivers and streams throughout the Greater Wellington Region. The survey data is processed by GWRC and compared to data collected from previous surveys.

3.2.5 Riparian Planting of Buffers

A river buffer is an envelope of land beyond the river channel on all western rivers that is allocated for erosion control and protection – often, but not exclusively, in the form of trees. Establishing these envelopes is useful for other common river management methods, including: channel management envelopes; bed level monitoring; and riparian planting of buffers.

In the Wairarapa, the planting of willow tree buffers for river and erosion management has been a practice for more than 30 years. The advantages of riparian planting of buffers include:

- Reduced lateral erosion and sedimentation;
- Improved meander alignment and reduced channel distortions;
- Cover and habitat for wildlife; and
- Reduced nutrients and pathogens from runoff entering the waterways.

The establishment of vegetation can increase resistance to erosion along a bank edge without preventing it altogether. In effect, it slows the erosion process, meaning less land will be eroded compared to bare, unplanted land. Whilst willow trees are frequently used to bind the river bank material together, this FMP directs a move towards a more diverse mix of planting for both the western and eastern rivers.

Land which is included within buffers may incur erosion damage prior to erosion control measures being established. For example, during a flood event, a buffer may erode prior to subsequent planting being established along a lowered river margin. In some instances, these buffers will naturally refill with gravel and be replanted as river meanders migrate downstream, and at other times these buffers will be artificially reconstructed by machine work and replanted.

Buffers that are already planted may incur some loss of vegetation due to allowing the river more room. This will depend on the land area, soil types, bank slope, land use, type and density of vegetation.

High banks or erodible cliffs can be included within the buffers. In these cases, vegetation cannot be planted in the buffer because their root zone will be too high above the river to be effective in slowing erosion (or for tree survival). The common method approach is to allow the buffer to partly or fully erode so that riparian planting of buffers can be established at river level to protect the land behind the buffer.

There has been mixed success historically in the establishment of riparian planting of buffers or edges across the catchment as nearly all the land on which these buffers exist is privately owned. Riparian planting of buffers is not currently recognised economically within the schemes for their value in managing river erosion.

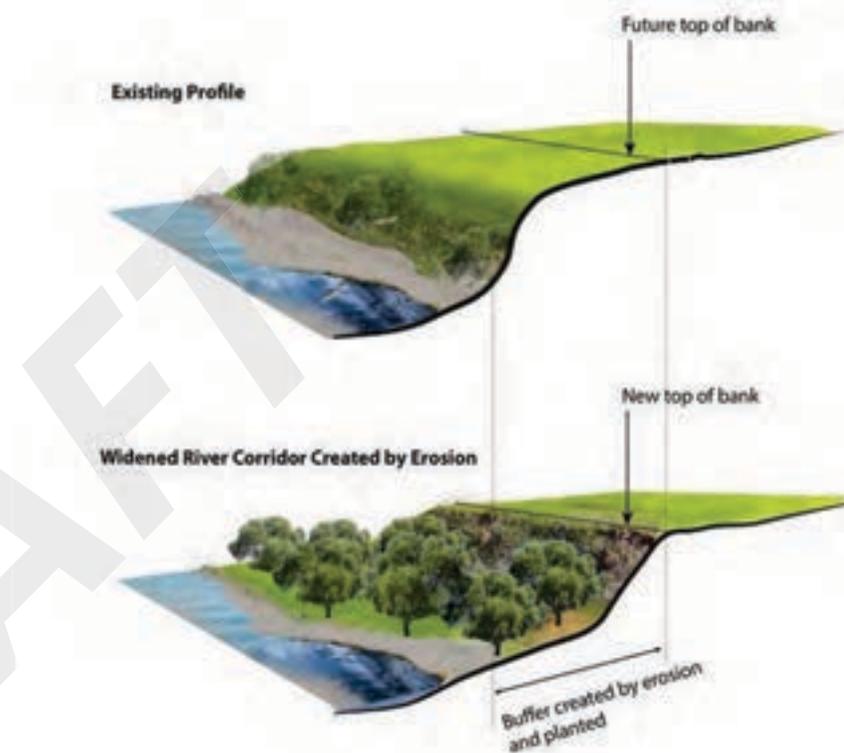

There is considerable opportunity to combine riparian planted buffers with environmental enhancements (explained in Section 3.5) such as including wetland areas where appropriate. The Environmental Strategy will identify areas where greater environmental enhancement opportunities exist. This process can also identify sites where landowners are keen to participate in environmental enhancement efforts, areas where wider buffers could be established and/or areas where additional land could be purchased.

There are many benefits of planting the western buffers and planting the river bank edges of the eastern rivers. The following points outline the main benefits of planting:

- Bank stabilisation, which helps reduce fine suspending sediment inputs;
- Assisting infiltration of surface runoff, therefore reducing contaminant input to the rivers from land use activities;
- Improvement in water quality by reduction of sediment inputs and contaminants from land use activities;
- Improvement in biodiversity and visual amenity;
- Regulation of instream temperature;
- Improving the rivers natural character; and
- Improving cultural values with native planting.

It is also recognised that the benefit of a given buffer width is dependent on the land use, soil type, bank slope, and type and density of riparian vegetation.

The width of a buffer has an effect on the benefits to the river. Some studies have indicated that a buffer width of 30m will protect stream health, while others have recommended a 50m buffer width. A more significant aspect of buffer planting is the

length of the buffer for bank stability and invertebrate communities due to a reduction in water temperature.

Economic benefits of riparian planting are related to the economic value of ecosystem services which benefit humans by increasing water quality, aquatic life and decreasing sediment and contaminant loading.

It is recognised that along with benefits there are also risks associated with planting the western river buffers and the eastern river banks. The following risks have been identified:

- Potential for increased roughness, sediment migration and channel realignment which may cause unexpected change of active channels with potential for overtopping and avulsion;
- Buffers may erode with lateral channel shift and therefore erode the vegetation;
- Weed control costs
- The balance between giving the river more room for its natural hydromorphology and the constraints of current infrastructure and channel form will be difficult.

The rivers will need to be monitored via surveys using LiDAR and/or drones to identify any of these potential risks before they become a reality.

With regards to weed control, it is recognised that it may take up to five years post planting to control weed growth.

3.2.6 Mixed Riparian Planting within Buffers

As mentioned in Section 3.2.5, river management in the Wairarapa has relied heavily on willow planting to maintain stable bank edges. This was because willows are fast growing robust trees with branch growth that can reduce flood velocities on berms, and dense root mass that can bind the bank-edge soils together. Willow trees could be mechanically transplanted and had been noticed to be more resilient to stress and more likely to survive compared with many other species.

This FMP encourages a transition from an exotic willow monoculture approach to a mixed native/exotic riparian approach across the entire buffer. This approach is used both regionally and nationally. Depending on the location, this could involve using willows for front-line defences and using natives further away from the active bed. Alternatively, under-planting natives into willow stands may occur and when natives are mature enough, the removal, where practicable, of what remains of the willow stands can be carried out. The eastern rivers will continue to have crack willow removal undertaken followed by planting of hybrid willows and/or natives along the bank edges.

Including a range of suitable native plant species provides the added benefit of improving biodiversity, enhancing visual amenity, improving water quality, and further stabilising stream and river beds. There is also a growing realisation of the long-term risk of pests and disease when using only willows for river bank plantings. Mixed planting can reduce this vulnerability.

This FMP encourages the creation of opportunities for innovation and research to explore various options and identify the best methodology for mixed riparian plantings in local circumstances. Examples where mixed riparian planting has happened along the river could be identified to produce information on the implications and potential for success. There is also an opportunity to explore (with tangata whenua) the planting of rongoa, or traditional healing plant species in areas that can be accessed by the public.

Initiatives to plant and maintain mixed riparian planting within buffers should ideally be led by the community. GWRC will be able to provide plants and some resources to assist the planting, but ongoing maintenance will rely on community input. GWRC has already established good working relationships with landowners who are part of river management schemes, but could explore opportunities to broaden the involvement of these groups and those landowners outside of these river scheme areas. Through the Community Support Officer (recommended by this FMP in Section 3.5.2), advice and support will be made available to landowners who wish to explore mixed riparian planting within buffers.

3.2.7 Pest Management in Riparian Planted Buffers

Introduced pest plants and animals can threaten our health, economy, Māori heritage, recreation, native plants, animals and habitats. Depending on the species that need to be controlled and the area to be covered, the method and therefore cost of controlling pest management will vary.

Within Te Kāuru, approximately 880 ha of riparian planting (once all planting is complete) will need to be controlled for various pest plants (such as old man's beard and blackberry) and pest animals (such as possums and rabbits). Due to the wide range of species that may impact the buffers, spraying will likely be the most effective method for control of pest plants, while trapping and poisoned bait will be the most effective for pest animal control.

Pest control will be supported by the Riparian Management Officer (Section 3.5.3) and implementation is discussed in Section 4.4.2.

Blackberry along the Ruamāhanga River

3.2.8 Pool, Riffle, Run Envelope

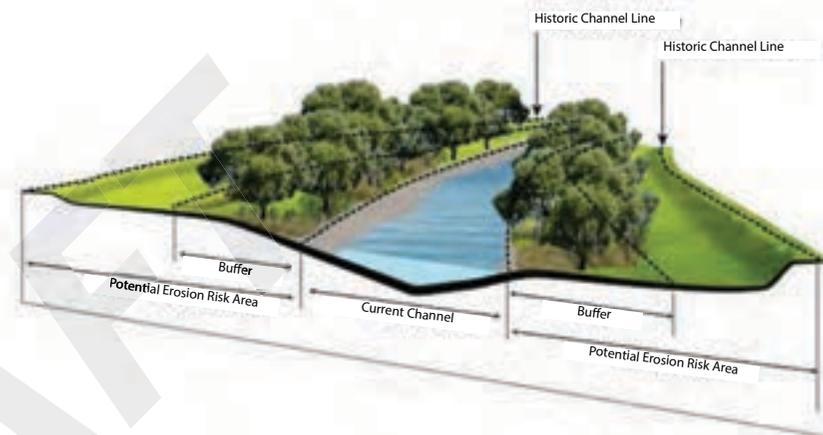

In many rivers, the channel and water level are naturally regulated by sequences of ‘pools’, ‘riffles’, and ‘runs’. A diverse mix of flows and depths is important in a river system to help create the variety of habitats for fish and invertebrate life, and can also support a range of recreation activities. In a meandering river bed, this diversity is largely provided by the number and occurrence of pool – riffle – run sequences.

A pool, riffle, and run count is a method for ensuring habitat and river form diversity is maintained within a managed river system. Within a highly managed or stable river it is practical to set an exact number of pools, riffles, and runs.

The reaches of the gravel fed western rivers flowing from the Tararua Ranges will have a pool, riffle, and run count assigned, with a defined upper and lower acceptable limit per river management reach forming an ‘envelope’.

This method will not require intervention in the river system to modify natural changes to the pool, riffle, and run count that may occur during flood events. Use of the pool, riffle, and run count will only be required to inform the planning of the river maintenance works.

The pool, riffle, and run envelope will be included in monitoring and performance measures. By counting the numbers of pools, riffles, and runs, the form of the river and its changes between the surveys can be assessed and compared. In the long term, it will aid the understanding of the trends occurring in the rivers in connection to river maintenance works.

3.2.9 Historic Channel Lines

The river system has in the past meandered widely across the Wairarapa Plains. Some of these historic channels are clearly identifiable due to locations of old river terraces visible in the landform (such as the hillside behind Oxford St in Masterton). In other cases, these historic channels have been infilled to change the land use in that area. During large flood events, these areas of infilled or old channels are often reoccupied by rivers and may become areas of higher hazard or subject to greater erosion impacts.

The identification of photographed and observed historic channel extents on plans within the FMP, and on the operational management plans, will raise awareness of historic landforms and assist informed decision making by property and asset owners when siting infrastructure.

These historic channel lines would be used in an information-only approach, to identify those assets of a farm or business that would not otherwise be controlled under district plan rules for avoidance of hazard. This is intended to include irrigators, cattle shelters, some farm outbuildings and other utility type structures. It may also help with siting of roads or other infrastructure.

3.2.10 Isolated Works Support

GWRC may provide, on application, a financial contribution towards river works that fit within the Isolated Works Policy. Isolated works are privately owned flood or erosion protection works that are undertaken outside areas where GWRC manages river schemes. The intent of the contribution is to provide a level of service to the areas that are not eligible for works under river management schemes.

Minor alterations to the Isolated Works Policy will be undertaken to provide an opportunity for people within existing schemes to access this support. For example, support should be available for erosion control within a river management scheme area if erosion control is not provided for directly in the scheme's level of service. As the Policy is currently written, funding is strictly for areas outside of any existing schemes and this is to be reviewed.

3.2.11 Alternative Land-uses within Riparian Planted Buffers

Riparian planted buffers, in most instances, currently serve only a single purpose of making land available for erosion control and protection. Some alternate land uses have been trialled to recognise potential revenue streams from these parcels of land that are not available for the adjacent rural land use (usually cropping, dairy or sheep and beef). Such additional revenue streams could include beekeeping and growth of willows as an alternate fodder crop for drought periods.

Through the Community Support Officer position recommended by this FMP (as an Environmental Enhancement response), advice and support will be made available to landowners who wish to explore additional revenue opportunities from the riparian planting of buffers.

There may also be opportunities for land leases for public recreation, access, and flood protection and erosion control purposes.

3.3 Planning and Policy Responses

Planning and Policy responses can include flood mapping; zoning land; rules restricting the type of development allowed in flood-prone areas; development of standards for activities undertaken in flood prone areas; and plan provisions (i.e. rules or consent conditions) to ensure the operation, maintenance, and protection of flood protection works.

River management envelopes which are subject to active erosion could be recognised within district plans, through hazard mapping, zoning and designations, or any combination of these mechanisms.

Plan provisions may also need to consider such matters as location, building, maintenance, operation, and protection of structures, such as stopbanks, weirs, groynes, flood gates, diversions, or other flood protection measures when writing objectives, policies, and rules.

3.3.1 Land-use Controls

To reflect the updated flood and erosion information, District Plan amendments are required to update recommended land-use controls. Amendments include overlays and zones that capture provisions of:

- River Corridor
- Overflow Path
- Ponding (inundation area)
- Residual Overflow
- Residual Ponding
- Erosion Hazard

This FMP concludes that the six-tier approach, or similar, more clearly defines the nature and extent of the flood hazards from direct flood risks and “residual” risks. To see this approach advance, changes need to be made to the Wairarapa Combined District Plan (WCDP). This process can either be carried out under a regular District Plan Review or a separate “Plan Change”. The main recommended changes to the WCDP involve:

- Introducing and mapping categories of hazard (preferably by way of a Flood Hazard Overlay).
- Restricting buildings/structures/earthworks in the River Corridor and Overflow Paths.
- Ensuring all new habitable buildings in Ponding and Residual Overflow have elevated floor levels.
- Not allowing any new subdivision in Ponding Areas, or critical infrastructure that doesn't take the hazard into account.
- Requiring setbacks from stopbank structures.

Until the changes to the WCDP are made, the information and outcomes in this FMP provide Carterton District Council and Masterton District Council with information that can be taken into account in any future planning applications. Furthermore, as an interim measure, the District Plan maps could be updated with the revised flood hazard information, without any need to change the underlying policies or rules. The timing of any review or change to the District Plan will be determined by Carterton District Council, Masterton District Council, and South Wairarapa District Council.

3.3.2 Designations

One of the methods GWRC is seeking to use is the Notice of Requirement process (under the RMA) to designate the major projects and the River Management Envelope on the western rivers.

Designations do not confer automatic access to the designated land. Most of the land designated for buffers, stopbanks, floodways and drains remain in private ownership. This is described in more detail in Sections 3.3.7 “River Management Access” and 3.3.8 “Land Access and Strategic Land Purchase”. A designation will enable GWRC to:

- prevent unauthorised activities (e.g. structures, planting and pipes) on or under the buffer or stopbank that could affect the stopbanks structural integrity;
- prevent access onto the buffer or stopbank from unauthorised vehicles, and;
- prevent the location of obstructions (shelter belts, tree planting, structures) in the floodway that would adversely affect the conveyance of floodwater in a flood event occurring within the designated areas.

3.3.3 Flood Hazard Maps

Flood hazard maps were produced prior to preparing this FMP to help understand and communicate the flood issues. The maps are generated using computer modelling to predict flood behaviour, along with historical data to match the model as closely as possible to past events. A 1% AEP event is used in line with regional policy and guidance documents, but a range of other events are also mapped, including historical floods, and those both smaller and larger than the 1% AEP.

Climate change impacts are included in most of the scenarios because this FMP considers the outcomes with long timeframes where predicted climate change will be significant. Consideration of climate change is required under national guidelines, as well as GWRC policy. Uncertainties in the data and other factors that cannot be included directly in the model are also considered via a freeboard allowance in modelled flood levels.

Mapping is undertaken at a catchment scale rather than modelling the flooding behaviour in detail at a particular site. This scale is appropriate for planning the solutions to flooding, informing emergency management and providing advice on flood hazard for existing or new developments. GWRC uses the information to meet its statutory requirements to understand and manage flood risks. District Councils use the information in carrying out their obligations in District Planning, providing Land Information Memoranda (LIMs), and their functions under the Building Act. Flood hazard maps are important inputs to many of the other common methods.

The flood hazard maps are peer reviewed and represent the best information available at a particular point of time. Over time, technology and information change (for example, more powerful computers are developed, and the length of rainfall or river flow records get longer). The flood hazard maps are updated from time to time to reflect these changes and to make sure the information continues to be fit for purpose.

Flood hazard maps will be used to support future plan changes for the WCDP. Depending on the timing of the plan change, and the level of information required at that time, further development work may be required for the flood maps and particularly the erosion hazard areas at that time.

3.3.4 Rural Stopbanks Policy

Stopbanks are embankments built to stop floodwater from rivers flooding nearby land. They may just look like grassy banks, but they have been constructed according to specific engineering designs and standards.

The established stopbanks in the Te Kāuru area have a variety of levels of service (or capacity levels) defined by an AEP. The definition and identification of level of service for each stopbank is identified within each reach in Part 2.

In assessing the level of service of each stopbank, some existing “legacy” stopbanks within the river schemes have been identified that are less effective in terms of who they benefit and what service they provide. This gives rise to issues of equity between different areas or landowners. To ensure a more equitable outcome can occur, this FMP provides guidance for each stopbank asset, including options such as maintaining, retreating or retiring/transferring the asset. This becomes particularly important when existing stopbanks are located within the buffer. Removing or retreating rural stopbanks from within the buffer will not be considered a high priority for implementation until the integrity of the stopbank is threatened.

This FMP does not propose any new stopbanks to protect rural areas with the exceptions of Akura Road just north of Masterton, and a consideration of stopbank alignment at Rathkeale College. It is possible in the future that a private landowner may propose to build a stopbank to protect their land. GWRC will consider whether it supports or opposes such a project on a case-by-case basis including consideration of:

- The benefit provided by the stopbank
- Impacts on the flood hazard to other properties
- Vulnerability of the land behind the stopbank, including in the case of stopbank failure
- Stopbank level of service (including that the level of service is not too high, thereby facilitating inappropriate residential development), and
- Impacts on river management, particularly distance from the river.

3.3.5 Scheme Funding Decision Making Policy

The 2019 scheme funding model addresses flood events up to a 20% AEP event through annual rates, and between 20% AEP and 5% AEP event through reserves. Floods bigger than a 5% AEP event can access funding from GWRC’s Major Flood Damage Reserves. Central government funding may be made available following a major flood that exceeds a 2.5% AEP event. However, if additional funding cannot be obtained, damage may need to be tolerated in events greater than 5% AEP magnitude or repair works may need to be completed using debt funding. The decision-making process regarding works required in excess of these funding levels will be clarified by development of a policy that will determine:

- What works can be carried out under annual works;
- What works can be carried out using reserves; and
- How decisions are made regarding works that exceed reserve funds.

3.3.6 Abandonment / Retirement of Assets

There are a number of assets that no longer provide the service or perform the function for which they were designed. These assets have been identified within each reach, including the method of retirement/abandonment and an indicative time frame where practical to do so.

As a general rule, assets for flood protection that exist within a river management envelope will be retreated to a less erosion prone location, or abandoned/retired, although this will not become a priority until the integrity of the stopbank is threatened.

3.3.7 River Management Access

GWRC requires access to land in order for works to be carried out, either for river channel management or for the construction and maintenance of assets. Often this access needs to be ongoing and have a reasonable degree of certainty. There are a number of ways of achieving this, including:

- Informal access agreements
- Formal access agreements
- Esplanade strips (created during subdivision)
- Easements
- Designations
- Land purchase

The existing river management schemes rely largely on informal goodwill and willingness from landowners to allow river works and buffer establishment on their properties, although GWRC's existing stopbank assets have been designated in the WCDP. As mentioned in Section 3.3.2, GWRC is seeking to designate the river management envelope in the District Plan. This will clearly identify that this particular area of land is needed for river management purposes and would enable GWRC to control activities and/or structures that can be located on that land. Before any Notice of Requirement to designate land is made, further consultation with the affected community would be required.

3.3.8 Strategic Land Purchase

GWRC's preference is to own the footprint of stopbanks (these may be leased back to the adjacent landowner for grazing). However, some landowners hold concerns about public ownership of river corridors and margins. These include concerns about the security of their property and changes to the way the land would be managed if in public ownership. In most circumstances in the Wairarapa context GWRC has designations over its structural assets.

Implementing the major projects described in this FMP will require significant works on private land. This may require land purchase in the future. Some of these physical works may be many years away but as a high priority in implementing this FMP, GWRC will seek designations over all sites where future major project responses require assets to be built or relocated.

Implementing the river management / buffer approach in this FMP in the western rivers will require changes in land-use, such as open areas of river margin being planted with riparian plants. In cases where the landowner would prefer to sell that land to GWRC rather than retain ownership, this FMP seeks funding for GWRC to be able to buy that land. This would also apply to landowners who have already set their land aside to establish riparian planted buffers because it is important that they are treated equally. This FMP does not seek to bring all river corridor or buffer land into public ownership. However, a strategic land purchase list will be developed, costed, and a plan put in place to acquire this land over time through mutual agreement via a strategic land purchase fund. This will need to align with reach-specific buffer recommendations, planned major project responses and high-priority sites identified in the Environmental Strategy. An indicative cost for this, based on purchasing half the land that sits within the river management envelopes, is \$5 million. GWRC will also support the creation of esplanade strips by District Councils when subdivision of riverside properties takes place.

The strategic land purchase fund will also be available for funding the retreat of infrastructure from the river management envelope. The contribution from GWRC would be in line with funding policies at the time with the remainder to be funded by the asset owner. The contribution from GWRC would be capped at a level based on an estimate of the cost avoided by retreating the asset. For example, GWRC may contribute to a road being retreated where doing so avoids the need to construct rock groynes. GWRC would contribute the difference in cost between building the rock groynes and what a standard, vegetated buffer approach would cost to implement and maintain. A more comprehensive policy will be developed as part of implementing this FMP.

3.3.9 Protection Against Deforestation in Upper Catchment

The upper catchments of the Western rivers fall within the Tararua Ranges, including in the Tararua Forest Park. Much of this area is protected as Department of Conservation Estate. Areas outside of this that are currently forested have differing levels of protection.

Rules are required to prevent deforestation within the upper catchments to ensure that the run-off characteristics of this area remain intact. This can be achieved through Regional Plan and District Plan rules, as well as advice and support from GWRC.

3.4 Emergency Management Responses

Emergency management plays a very important role in floodplain management planning. When a flood emergency occurs, how well a community copes depends entirely on how well prepared it is – this includes the preparedness of emergency services, public agencies, utility services, businesses, and ordinary residents.

3.4.1 Community Resilience

Community resilience means that communities are well prepared and ready for emergencies and have knowledge, skills, resources, and relationships to respond to and recover from a flood event. When a flood emergency happens, how well a community copes depends on how resilient it is.

Wellington Regional Emergency Management Office (WREMO) will work with the community to increase its resilience through public education programmes. Education symposia address three different target groups:

- Tools for business continuity planning will be offered to the community to increase resilience of their businesses;
- School teachers will be educated about emergency management; and
- Aged residential care facilities will be addressed specifically as these facilities are one of the most vulnerable areas.

Educational brochures developed by WREMO and supported by the materials from this FMP will be available for the public to inform their personal emergency planning.

An outcome of this FMP will be that GWRC provides WREMO with detailed mapping tailored to emergency management uses. These maps include vulnerable access routes or lifelines, and the scale of events that will cause these lifelines to be cut. Additionally, an address list can be produced for properties located within an extent of the 1% AEP flood event, with the intention that the community preparedness message is delivered to these property owners and occupants. Properties that are vulnerable to more frequent floods will be highlighted.

3.4.2 Flood Forecasting and Warning System

GWRC and WREMO together provide a flood warning service for the Wellington Region. Separately from formal warnings, GWRC also makes environmental data, such as river flows and rainfall amounts, available to anyone via a range of methods including its website.

Flood warning is recognised as a major tool for equipping people to take their own actions to avoid flood risk. In a large flood or in areas that have very low levels of flood protection, flood warning is crucial for people who are exposed to these hazards and for emergency managers who are trying to minimise risk to life and property.

The development of this FMP has led to a number of suggestions for improvements to the system. This has occurred in parallel with a 2016 review of GWRC and WREMO's flood warning system.

As an example, some potential areas that have already been identified for investigation or improvement are:

- More focus on supporting people to plan their response to flooding, so that the warning will result in people taking effective action;
- Use of automated technology to supplement telephone trees;
- Providing the means for recipients of flood warnings to manage their own subscriptions to alerts (so that details are kept up to date);
- Additional or relocated gauges to provide greater warning time (especially on the upper reaches of rivers);
- Purchasing advanced weather forecasting and/or supporting improved forecasting through financial contributions (e.g. contributing to a new weather radar site);
- Improved reliability of communications for critical warning sites;
- Additional resourcing to carry out more river gauging to improve the accuracy of flow estimates;
- Opportunities to expand or develop the flood forecasting system to give advance warning of flooding; and
- Developing ways to monitor river flow gauges for landslide dam formation, especially during heavy rainfall events.

3.5 Environmental Enhancement Responses

Environmental Enhancement responses seek to raise the awareness and understanding of the natural values and character of the river environment to encourage and support environmental restoration and maintenance efforts. The primary goal of environmental enhancement responses is to recognise and improve environmental values alongside flood and flood risk management.

3.5.1 Environmental Strategy

The Environmental Strategy coordinates the projects required to deliver the environmental, amenity, and cultural outcomes sought by the FMP that are beyond those achieved solely through flood and erosion risk management. It also helps to coordinate the actions of groups involved in managing the rivers and creates a strategy to enable these groups and organisations to work in a supportive manner.

The preparation of the Environmental Strategy is to be undertaken either in partnership or close collaboration with other affected or interested parties, including, but not limited to, the District Councils, Department of Conservation, iwi, Fish and Game, Forest and Bird, and other identified stakeholders.

The table below sets out the identified environmental issues for the Te Kāuru Upper Ruamāhanga River system and outlines the general actions that can be taken to enhance the river environment.

ENVIRONMENTAL ISSUES AND ACTIONS

ENVIRONMENTAL ISSUES

Access and private ownership
The majority of the land adjacent to the river is in private ownership. Public access to the river is generally limited to the areas in the DOC estate, including upstream areas of the Ruamāhanga and Waingawa, and urban areas of the Waipoua River

Weed management
The buffers are infested with weeds including blackberry, tree lucerne and old man's beard

Crack Willow and Grey Willow
Historically, Crack willow (*Salix fragilis*) was used extensively through the Te Kāuru Upper Ruamāhanga catchment

Loss of Diversity

Loss of mahinga kai

River management
River management methods, particularly bull dozer operations in the channel, impact on the environment. These impacts can include loss of aquatic habitat, reduction in water quality and associated reductions in amenity values

Straightening of river channels

IMPROVEMENTS

Work with District Councils and support recreation opportunity improvements, including connecting access along the Waipoua, Ruamāhanga and Waingawa Rivers

Support landowners who wish to retire farm land and advocate for improved recreational access
Integrate riparian planting and wetland creation opportunities with buffer establishment. For example, where buffer land is being purchased or retired in partnership with willing landowners, look at opportunities to create a wider buffer to allow for wetland creation/restoration and native planting behind

Weed clearance programmes
Yearly checks to ensure areas of weed infestation are identified. This shall inform measures required to ensure weeds are kept under control

Reduce the presence of crack willow and restore ecological value to the eastern rivers
Use hybrid willows (such as *Salix matsudana* and *tangoio*) when carrying out new plantings and, when suitably mature, for use in other protection methods to minimise self-propagation potential
Advocate for private planting of natives in association with willows and outside vegetated buffers

Improved buffer planting and widened strips will help improve diversity
Support landowners who wish to retire farm land and carry out native planting.
Provide information on how to access contestable funding to support these efforts

To be developed in association with Kahungunu ki Wairarapa and Rangitāne o Wairarapa

Minimise impacts by undertaking works in accordance with the Code of Practice (for river management activities)
Utilise other measures which require less regular and /or extensive in stream river works, where possible

Seek to allow the river more room to move and maintain natural processes

3.5.2 Community Support Officer

GWRC works with communities to manage flood risk from the region's rivers and streams. This includes developing floodplain management plans, providing an advice and consultation service in relation to flood and erosion risks, maintaining and building new flood protection works, maintaining or improving the environment and recreational opportunities, and providing management and advice to Civil Defence during large floods.

Further opportunities exist for GWRC to build upon existing relationships with landowners, iwi and the wider community who wish to be involved in the health of river environments.

There is potential to establish a part time or full-time role to support and advise the community on local projects and initiatives relating to the river environment (i.e. Community Support Officer). The key tasks of this role will include:

- Providing a point of connection with the community;
- Building relationships with local river recreational groups;
- Reinforcing partnership with iwi;
- Calling for volunteers through GWRC website, social media and volunteer websites;
- Facilitating practical education days with community groups including schools, marae, and business organisations; and
- Showcasing the areas of concern in the region and the positive results of volunteer efforts at local events to encourage greater participation.

This role could be facilitated by including a portion of current officer working time for community support and drawing on local expertise and knowledge to work with the broader community, current scheme committees, and landowners. For the Eastern Hills area, this role could cross over with Land Management advisors who already work with rural landowners and have established relationships in the area.

GWRC would seek partnerships with other organisations or agencies to fund this role.

Photos courtesy of Don Rutherford, riverside landowner undertaking native enhancement planting on his section of Waipoua River.

3.5.3 Riparian Management Officer

A new role is sought as part of this FMP to focus on the establishment and maintenance of riparian plantings within the buffer and ensuring that there is a coordinated approach to pest management within the buffers. Responsibilities could include managing the budget and distribution of traps and sprays for landowners to undertake their own pest management; assisting in the development of riparian management plans for buffers; coordination of community groups, volunteers, etc. who wish to assist with plantings and maintenance; and undertaking weed management on planted sites for up to two years post planting.

3.5.4 Care Groups and Clubs

Healthy streams and rivers are an asset for any community. They are peaceful and fun places to be near, have cultural significance and can be full of wildlife.

River care groups can participate in their local rivers by involvement in:

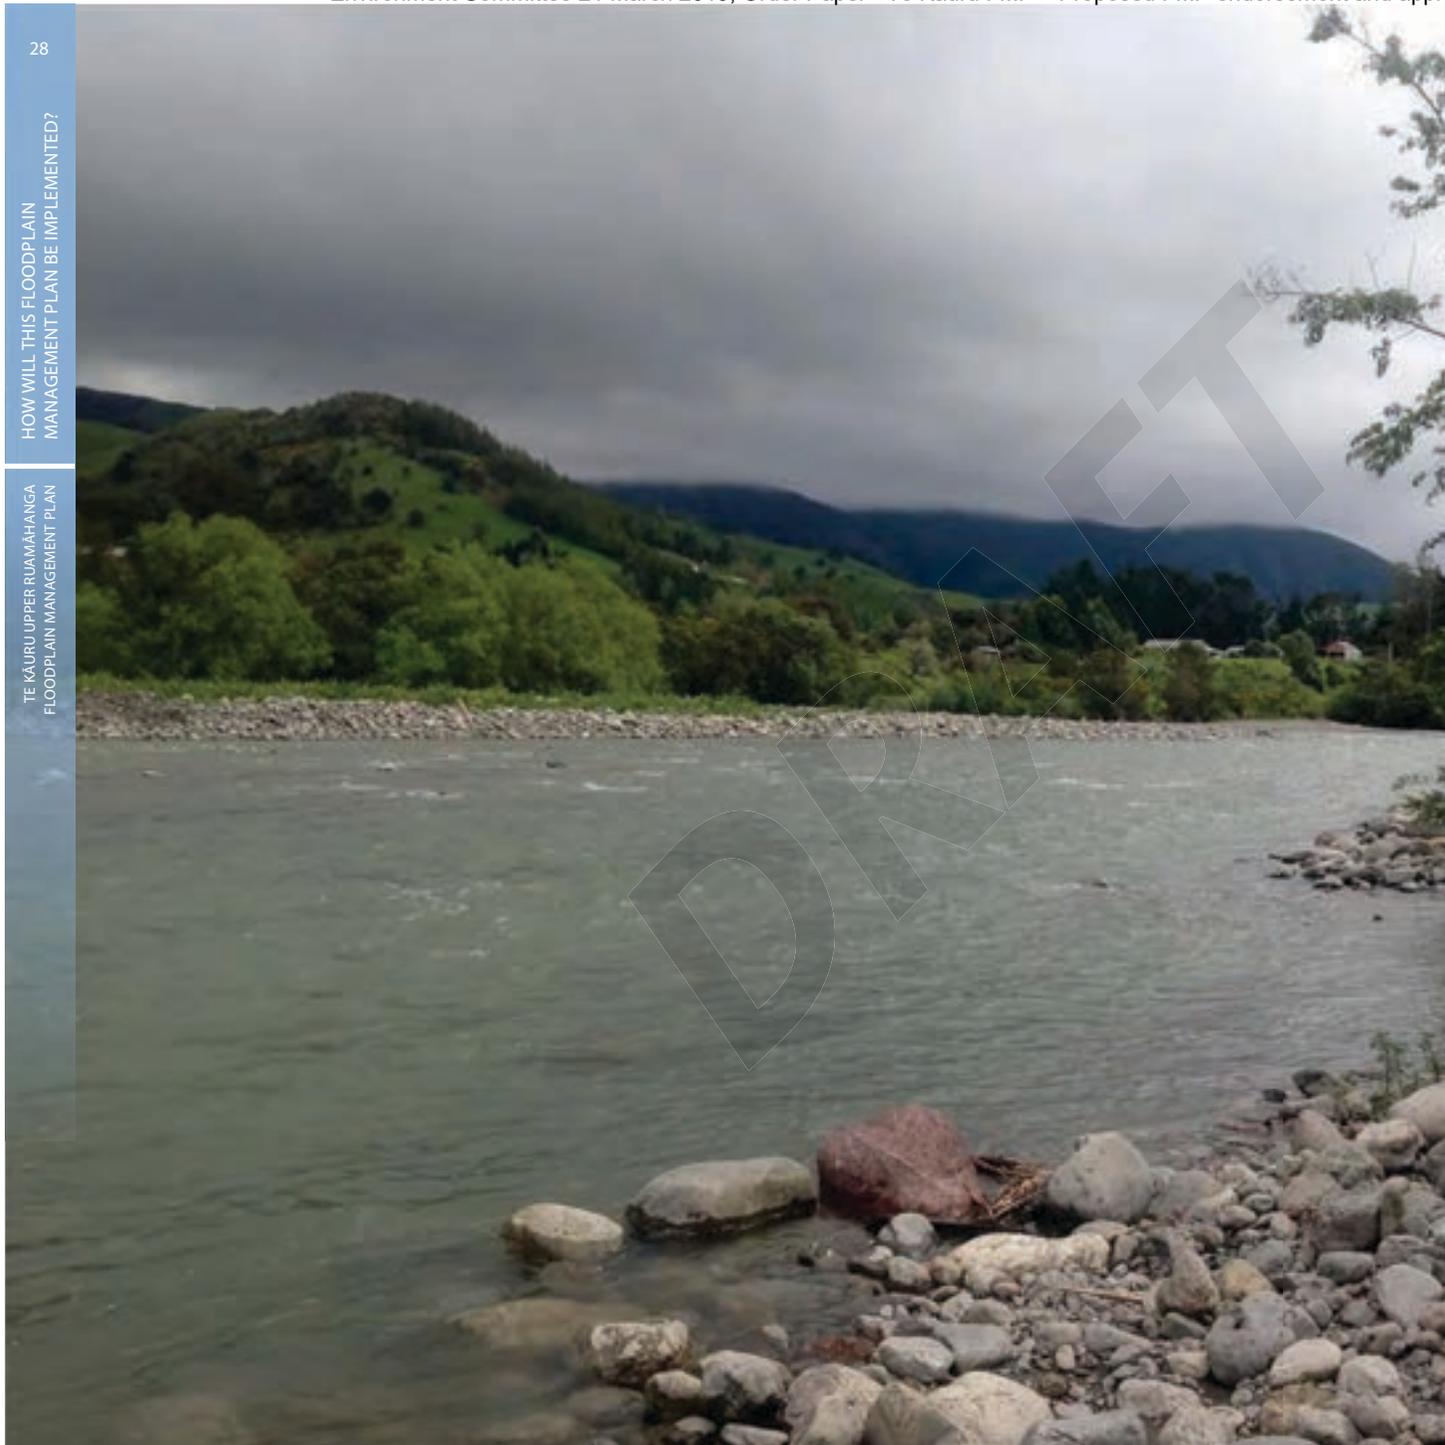

- Delivering native planting programmes and/or other Environmental Strategy outcomes;
- Maintaining vegetation to prevent waterway obstruction;
- Encouraging the community to take a greater interest and have greater involvement in river environments;
- Advocating and working with landowners to improve access;
- Managing animal and plant pests; and
- Monitoring and reporting on river management and FMP implementation on behalf of the community.

The western rivers of the Wairarapa are perhaps more suited to the care group concept than those in the eastern half of the valley, given that they have better public access and higher rates of recreational use.

There are a number of care groups that GWRC works with in the Wairarapa. The range of tasks carried out by river care groups can include:

- Strategic planning: developing a stream restoration plan and timeline for the work;
- Communications: keeping all interested people informed;
- Baseline assessment: walking the river/stream and recording what state it is in at the start, so there is something to measure improvements against;
- Research: working to find the most successful and efficient techniques for improving the health of the stream/river; and
- Operations: rubbish removal, planting, weeding and other jobs to restore and maintain a healthy stream/river.

As mentioned in the previous common method description, establishing a Community Support Officer at GWRC will assist in building community relations and encouraging the establishment of new river care groups in the western half of the valley.

4. How will this Floodplain Management Plan be Implemented?

This section sets out how the flood protection and management measures in the FMP will be implemented and funded. In short, the implementation measures outlined in this section will be carried out by a number of different authorities and individuals.

4.1 Governance

For over 50 years river management schemes have been maintained to protect people, property, infrastructure, and productive rural land in the greater Wellington Region. The schemes have been designed to reduce, mitigate, and manage the flooding and erosion risk throughout the region. The schemes have been drafted and implemented at various times based predominantly on the wishes and support of the local communities.

The Te Kāuru area includes eight existing schemes that make up a large portion of the floodable land area in the Te Kāuru Upper Ruamāhanga area.

Each scheme has an annual maintenance programme which is identified prior to the start of each new financial year. This programme identifies and prioritises work to be carried out within that financial year. Each scheme also has a committee which is made up of directly affected landowners adjacent to the respective river or reach of river, as well as GWRC and territorial authority representatives. Schemes within Te Kāuru reported to the Environment Committee of GWRC.

4.1.1 Governance Structure

For this FMP, the governance structure will comprise a formal Advisory Committee being the 'Upper Ruamāhanga River Management Advisory Committee'. The specific responsibilities of this committee are outlined in Section 4.2.1 below.

The Advisory Committee will make recommendations regarding implementation of the FMP to GWRC. The Advisory Committee will act as a point of contact for members of the public, landowners and other stakeholders for any issues they have regarding the plan, including the implementation methods and action plan.

The Advisory Committee will be made up of six representatives from river management groups (renaming of existing scheme committees) within the Te Kāuru area (including one from within the eastern scheme areas). It will also include two representatives from Carterton District Council, three from Masterton District Council, two from GWRC and two iwi representatives.

As witnessed through the implementation of previous schemes, community input is invaluable to implementation, given the wealth of local knowledge and experience they contribute. Additionally, the diversity of representation and knowledge within the scheme committees has improved with the inclusion of representatives from DoC, Fish & Game and iwi representatives. This involvement has contributed to an increase in understanding of the broader values and benefits from the river management work undertaken. In time, representation may evolve further so as to continue to represent the communities through which the rivers flow, as these communities change. The scheme committees will be renamed as 'river management groups'.

The river management groups will continue to be made up of landowner representatives and other community groups and organisations. The reporting structure of the river management groups will be retained. In this respect, the river management groups will continue to have an annual meeting supported by Flood Protection staff from the GWRC Masterton office to consider the annual maintenance works programme and associated expenditure. The river management groups' representatives will then be able to take these views to the Advisory Committee which in turn reports to GWRC.

The Advisory Committee will meet more frequently than the existing scheme committees do (perhaps quarterly) in the initial implementation stages of the FMP implementation.

The Advisory Committee will report up to Greater Wellington Regional Council through appropriate committees. Currently, a specific responsibility of the Environment Committee is to, among other things, monitor and oversee the development and implementation of floodplain management plans, including the Te Kāuru Upper Ruamāhanga Floodplain Management Plan. The relevant specific responsibility of the Wairarapa Committee is that it may consider and make recommendations to Council on flood protection issues relevant to the Wairarapa.

This new governance structure will align with the funding structure changes. Funding changes are to spread the targeted rate portion of rates across the Te Kāuru catchment and therefore the governance structure will allow for the Te Kāuru catchment community involvement.

4.2 Responsibilities

The following parties have direct or indirect roles in implementing this FMP:

4.2.1 Upper Ruamāhanga River Management Advisory Committee

As discussed in Section 4.1.2 above, an advisory committee will be established to monitor the implementation of this FMP. The role of this advisory committee will be to ensure the action plan in this FMP is further developed and implemented, including monitoring progress against actions. The Upper Ruamāhanga River Management Advisory Committee (Advisory Committee) will be established by GWRC and operate under an agreed Terms of Reference.

The Advisory Committee will also act as a point of contact for members of the public, landowners and other stakeholders for any issues they have regarding the plan, including the implementation methods and action plan. The Advisory Committee will make recommendations on implementing this FMP to GWRC and other organisations with responsibilities in this area.

4.2.2 Greater Wellington Regional Council

GWRC will be responsible for the overall coordination and monitoring of this FMP, as well as relevant physical flood protection structures and works such as river management and stopbanks. In addition, GWRC will provide flood hazard mapping and advise territorial authorities (based on this FMP) on flood hazard areas to inform the development of appropriate land use planning controls in the District Plan.

4.2.3 District Councils – Masterton and Carterton

Many of the land use planning control measures will be implemented by Masterton District Council and Carterton District Council through their District Plan. These Councils also have a responsibility to maintain and protect public assets, including several bridges established along local roads. District Councils would also implement some environmental enhancements (e.g. walkways on riverside reserves).

4.2.4 Landowners

Landowners in the floodplain are important parties for implementing identified actions as they are the beneficiaries of successful implementation of this FMP. In addition to landowner representation on the Advisory Committee, landowners may be required to work with GWRC staff on particular projects or works that directly affect their land, for example, the final composition of vegetated buffers. Landowners also play an ongoing role in maintaining projects or works (e.g. protecting stopbanks or vegetated buffers from damage by machinery or stock).

4.2.5 Community Groups and Other Parties

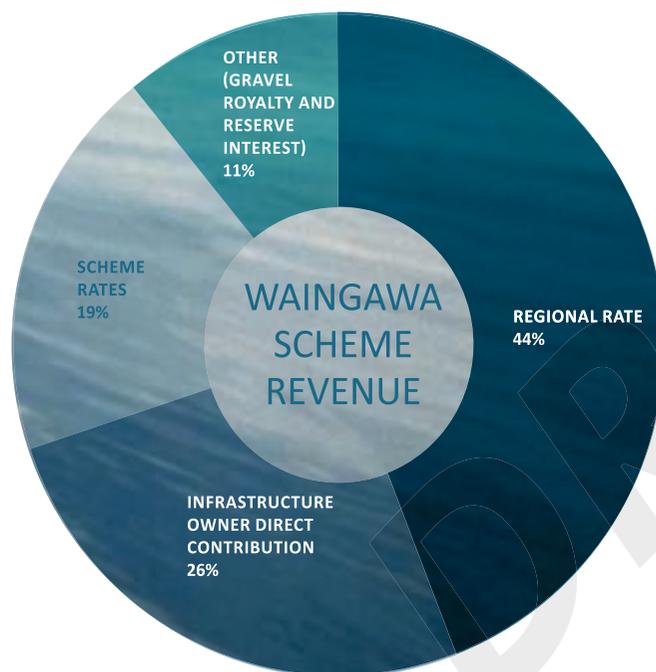

Interest or community groups can be a valuable resource and may help to implement various actions. They have significant local knowledge that is of importance in the management of the rivers for flood and erosion purposes. For example, community groups could assist and contribute to the work of other parties, including riparian margin planting works. The governance structure will encourage community groups to be a part of the river management groups.

4.2.6 NZ Transport Agency and KiwiRail

NZ Transport Agency and KiwiRail are responsible for the maintenance and protection of their assets in the Wairarapa, including bridges which cross the Waingawa, Waipoua, Ruamāhanga and Kopuaranga rivers.

4.2.7 Kahungunu ki Wairarapa and Rangitāne o Wairarapa

Kahungunu ki Wairarapa and Rangitāne o Wairarapa are partners with GWRC within the Wairarapa. This relationship includes maintaining meaningful engagement as required through statutory acknowledgements and as promoted under the proposed Natural Resources Plan (pNRP).

4.3 Funding Structure

There are significant costs associated with the flood management responses in this FMP. A new funding structure is proposed to support the implementation of this FMP. The measures will be implemented in accordance with the funding policy in place at the time.

4.3.1 Summary

Previously, landowners within the schemes funded a portion of the total scheme costs, also known as targeted rates. However, to recognise and reflect the wider benefit of the implementation measures of this FMP, it is proposed that these targeted rates be spread over all ratepayers in the Te Kāuru catchment.

The funding approach recognises that:

- The FMP seeks to provide greater security, a wider range of benefits, a needs-based approach to river works and some solutions to long-standing problems, particularly relating to water quality. This will, in the long term, cost more to implement and maintain than the current river schemes cost;
- The FMP will deliver wider benefits which should be funded from the wider catchment community;
- We are seeking to address current inconsistencies and complexities within and between the schemes; and
- In the FMP, the concept of using the buffer areas for river management purposes will require a change in use of affected land. This contribution has to be recognised or compensated.

The outcomes and feedback received as part of the development of this FMP have informed the FMP funding approach. The use of this approach, combined with the consultation on the Long Term Plan (LTP), are considered to meet the test of the “special consultative process” necessary to make such a change to the funding model.

4.3.2 Previous Funding Structure

With respect to funding, the schemes were divided into different categories, or classifications, depending on the flood and erosion protection benefit that landowners received. Landowners were then rated on the basis of which pieces of land fell into these different classifications. As experienced in the schemes, these rating classifications became outdated as situations changed or as needs changed based on new information. The ratings were also difficult to keep up-to-date as properties changed hands, or were subdivided and developed. They were overly complex – for example, the Kopuaranga scheme had 12 different classifications for a simple scheme of willow tree removal and management and only \$13,000 per year of rates collected. A proportion of the operational costs of the schemes were funded from the general rates paid by ratepayers across the whole Wellington Region (up to 50%).

GWRC agreed through the Long Term Plan (LTP) process in 2018 to retain the current funding policy for flood protection. This is subject to review through the LTP process every three years. The funding policy includes:

- The general rate to fund 100% of the work for the “Understanding Flood Risk” activity, and
- Up to 50% of the funding to come from the general rate for the other two flood protection activities of implementation and operations and maintenance.

Note that the “Understanding Flood Risk” activity is the investigations and modelling required to ascertain flood risk in our region as well as development of mitigation strategies through the development of Floodplain Management Plans.

The balance of the funding is termed the “local share” and must be contributed from the local community in some form. The “local share” is made up of:

- Local councils (TA) contributions for infrastructure protection;
- Gravel royalties;
- Interest on river scheme reserves; and
- Scheme landowners via a classification model.

Scheme landowners have previously contributed on average 28% but the amount varied between 16 to 51% of the total funding of the Te Kāuru schemes, depending on the scheme.

The example on page 32 shows the breakdown for contributions to the Waingawa River scheme in the 2017/18 financial year.

The rivers schemes, as a rule, did not carry out major works using loan funding (capital expenditure, or “capex”) but rather through annual budgets and use of flood damage reserves following major floods.

4.3.3 Drivers for Change in Funding Models

1. This FMP is proposing to spend money on major projects and general works that are not necessarily “scheme” based and are a departure from the current scheme approach of annual work programmes. This additional expenditure, likely staged over many years, must be funded and it is doubtful that the current scheme funding approaches are appropriate. We expect these would be loan-funded projects, or capex, and the existing model doesn’t accommodate this easily.
2. The projects and new approaches in this FMP to managing the rivers are intended to deliver a wide range of benefits including cultural, environmental, recreational, economic and social. The costs of delivering these wider community benefits should rest with the whole community.
3. The previous funding arrangements lead to some unintended outcomes. The scheme budgets were determined by how much the landowners were prepared to contribute, and the scheme budgets determined how much and what kinds of work was carried out. Seeking wider funding would assist a more coordinated, consistent, fair and needs-based approach.
4. The concept of using the buffer areas for river management purposes means that a change of use in some affected areas is required. A common theme resonating with the landowners of the schemes is that “if the community wants to use this land for community outcomes then the community should be paying for the scheme.” This FMP proposes a fair and equitable approach to funding including recognising that some landowners under the existing schemes have already agreed to flood protection measures on their land such as by allowing vegetated buffers to be planted.

4.3.4 Costs and Proposed Funding

At the time of writing, the total funding required to cover the eight schemes in the FMP area is approximately \$930,000 per year. Of that, riverside landowners, as a targeted rate, fund approximately \$290,000 of the \$930,000. If a district wide funding model is adopted and the \$290,000 currently paid by affected landowners was spread across all the ratepayers in the Te Kāuru catchment, the rate would be about \$4.8 per \$100,000 of Capital Value (or \$17 per year for a \$350,000 property for example).

The 2017/2018 total revenue in percentage and dollars for the eight schemes in the Te Kāuru FMP catchment are listed in the table below. Of this, the targeted rates (collected from scheme members), is the portion that is being proposed to be covered by a district wide rating.

2017/2018 Scheme Revenue breakdown

	TOTAL REVENUE FOR EIGHT SCHEMES	PERCENTAGE OF REVENUE
Regional rate	~\$407k	44%
Infrastructure owner direct contribution	~\$174k	19%
SCHEME RATES	~\$290K	28%
Other	~\$80k	9%
Total	~\$930k	\$100%

4.3.5 Cost to ratepayers

The benefits sought from this FMP include flood hazard and erosion protection, and enhancing environmental and cultural values of the river. These aim to benefit the wider community and the environment. The costs involved in this FMP relate to three separate changes or increases to rates: spread of the targeted rate; increased operational expenditure through general responses; and new capital expenditure through major projects. The increases in rates estimated are for the 'local share' as well as the increase in regional portion. These are based on the current model of the regional share being up to 50%. Therefore local share, collected through a targeted rate, is approximately half of the associated costs, but how they are distributed across ratepayers will vary.

Operational expenditure is used for annual expenses involved in flood and erosion protection, including on-going river management work and many of the general responses listed on pages 58 and 59. While the on-going river management costs are not expected to increase, there are additional operational activities proposed. Consequently a rate increase for all operational activities has been estimated at \$13 per \$100,000 of CV.

Capital expenditure funding will be used to finance the Major Projects Responses outlined in Part 2. The major project responses are estimated to cost a total of \$12 million. \$6 million of this will be rated across the entire region. The remaining \$6 million, the local share, will be funded through a targeted rate across the upper Ruamāhanga catchment. This would equate to a rates increase of approximately \$10 per \$100,000 of CV. For each of the Major Project Responses, guidance will be sought from MDC, CDC and the asset owner on whether each project will be funded more directly.

The timing of rate increases are estimated to be:

- 1-2 years – approximately \$2-3 per \$100,000 CV
- 3-5 years – approximately \$5-10 per \$100,000 CV
- 6-10 years – approximately \$10-23 per \$100,000 CV

4.3.6 Affordability and Willingness to Pay

Making sure the proposed works and funding arrangements are affordable and spread fairly is important. Staging of works will be crucial in ensuring the works are appropriately funded. The FMP will be implemented over decades and when individual works programmes have been confirmed, the prioritisation and staging of works can be agreed.

Councils fund their infrastructure works through Long Term Plans (LTP). Through the LTP process, Councillors weigh up all the work programmes and proposals for new expenditure and make decisions about what work should be undertaken, and when. This FMP will provide a key input to future LTPs and in the end, the pace of implementation will be controlled by Council decisions on expenditure and the budgets / spend outlined in the LTPs.

4.3.7 Scheme Reserves

Previously, the river schemes put money aside in reserve funds to cover years when there was a lot of flood damage. The value of reserves across the schemes varied between approximately 100% and 400% of the annual operational / maintenance budget.

The potential flood damages have not been assessed scheme-by-scheme to determine what the reserve targets should be. However GWRC applies a rule-of-thumb that reserves should be at least 200% of the normal annual operational spend. This reserve would only likely cover the 'clean-up' costs and emergency repairs immediately after the flood event, not any subsequent remediation works.

Without major flood events for many years, the reserve balances have built up. If there is any change to funding arrangements that affect how reserves are managed, then contributions made by scheme members over time need to be recognised and GWRC will ensure that reserve balances and debts are treated fairly.

In adopting a level-of-service based approach and the move towards funding river operations from the wider community, the response to flood damage in the future will be less dictated by reserve balances. The response will instead be to direct community funds into the locations where the urgency is greatest. Over time it is also likely that the existing scheme reserves would be amalgamated into a single reserve. If this approach is adopted, a transitional period would be required, whereby previous scheme reserves could be "earmarked" for expenditure within that scheme area only.

Central Government has also indicated that it is considering changes to policies on financial support to regions following a large flood event. This may trigger the need to reconsider appropriate reserve levels in the future. However, a reliance solely on Central Government support for large events is not assumed in this FMP.

4.4 Outcomes

This section of the FMP provides more detail for how major elements from each group of FMP responses can be implemented over time. It also includes a table of the general responses (Section 4.6.6) that are more catchment wide (not covered in Part 2) with an indication of cost and priority.

4.4.1 Structural

New structural measures, mainly stopbanks, will be delivered through site-specific 'Major Project Responses'. These responses are described in detail in Part 2 and summarised in the table overleaf. The majority of these projects have been developed in response to known problems and situations that have not been resolved through the works programmes contained in the existing schemes.

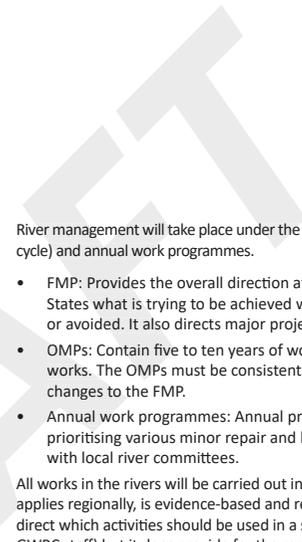

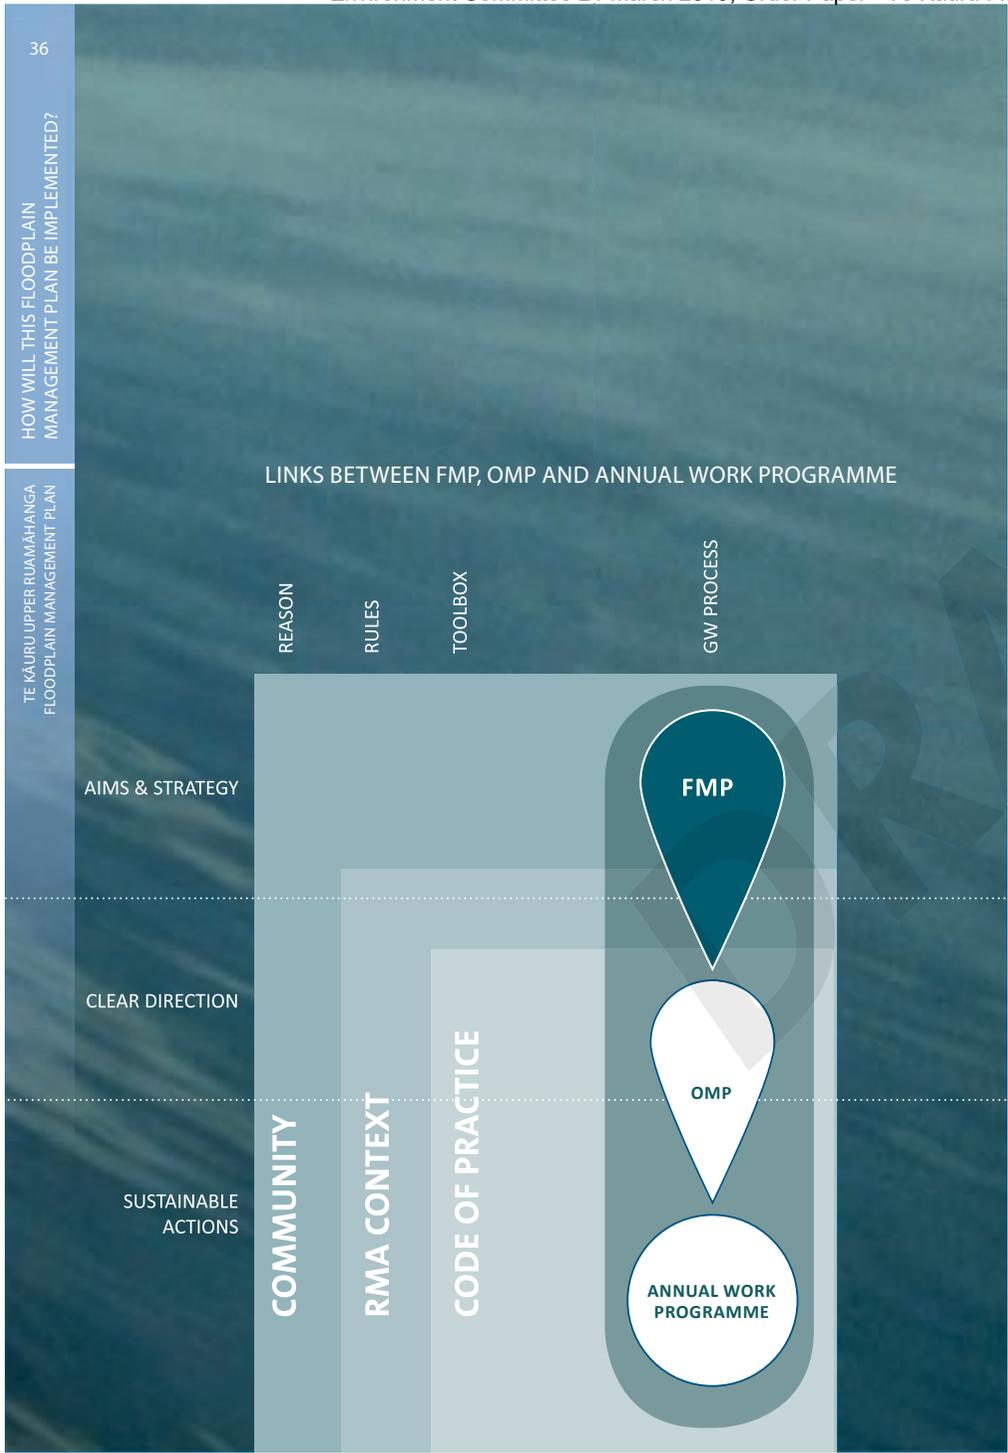

Response priorities have been indicated as High, Medium or Low. The prioritisation in this FMP has been based on community feedback, the nature of the known hazard, the nature of the associated risks, and the perceived urgency of rectifying the existing situation.

Generally, the High Priority Response Projects (refer summary to the right) will be carried out in the first ten years of FMP's implementation.

Major Project Response Summary (Refer Part 2)

NAME	MANAGEMENT MEASURE	PRIMARY REASON FOR RESPONSE	PRIORITY	COST	FUNDING
WAIPOUA URBAN REACH	Increase channel capacity and upgrades to existing stopbanks	To increase current and future flood protection to urban area of Masterton.	High	Stage 1 \$350,000	Capital funding TBC
RIVER ROAD PROPERTIES	Increase bank protection to river edge at River Road and widen river channel	To increase protection to River Road, Masterton	High	\$575,000	Capital funding TBC
RIVER ROAD PROPERTIES	Easements and other legal costs as required	To allow construction/maintenance of groynes and widening of the river	High	\$50,000	Capital funding TBC
	Targeted operational river management with revised emergency management plan	To manage risk of erosion posed to the water supply pipeline	High	Varying but of magnitude of \$5-20,000 per annum generally, with allowance for targeted emergency works as required	Operational funding
MDC WATER SUPPLY					
HOME BUSH WASTE WATER TREATMENT PLANT	Resilience works within headworks facility (plinth for generation, raising electrical works).	To increase resilience of HWWTP headworks in case of stopbank overtopping.	TBC	\$50,000	Capital funding TBC
PAIERAU ROAD	Permanent warning signs and improved flood forecasting	To increase the safety of road users by providing permanent warning signs and increasing lead time for road closure to 2.5 hrs.	Medium	\$20,000	Capital funding TBC
SOUTH MASTERTON STOPBANK AND URBAN GATEWAY	Contaminated site assessment, visual improvements within therecreational access and contaminated site buffer, establishment of public access to the river	Appealing gateway to Masterton, management.	Medium	\$100,000 for contaminated site assessment	Capital funding TBC
RATHKEALE COLLEGE STOPBANK	TBC	To increase flooding protection to Rathkeale College and reduce erosion risk to stopbank and Rathkeale College	Medium	\$1,000,000 TBC	Capital funding TBC
MDC WATER SUPPLY	Increase bank protection to river edge at Black Creek	To increase protection to water supply pipeline	Low	Up to \$300,000	Capital funding TBC
SOUTH MASTERTON STOPBANK	Retreat existing stopbank to less erosion prone location outside the buffer	Stopbank is non critical asset from flood hazard perspective but may be important for preventing contaminated material entering the river.	Low	\$485,000	Capital funding TBC
HOOD AERODROME	Rock line connecting terrace with existing rock groyne at the end of the runway	To increase protection to the runway and avoid any contaminated material being eroded into the river.	Low	\$755,000	Capital funding TBC

4.4.2 River Management

River management will take place under the hierarchy of this FMP, Operational Management Plans (OMPs) (developed on a five-ten year cycle) and annual work programmes.

- FMP: Provides the overall direction at a river- and reach-wide scale and principles/policies that apply across the rivers. States what is trying to be achieved with each reach and may give direction on particular management methods to be used or avoided. It also directs major project responses and any exceptions to the common methods.
- OMPs: Contain five to ten years of works programmes, including detailed priorities and management approaches for these works. The OMPs must be consistent with the FMP but through the preparation of the OMPs, these plans may propose changes to the FMP.
- Annual work programmes: Annual programmes of work, based on the OMPs but also dealing with reactive work and prioritising various minor repair and buffer implementation projects. Annual work programmes will be worked through with local river committees.

All works in the rivers will be carried out in accordance with GWRC's Code of Practice (COP). This is a consented document that applies regionally, is evidence-based and regularly updated to provide standards of good management practice. The COP does not direct which activities should be used in a specific location (this should come through the hierarchy above and the decisions of GWRC staff) but it does provide for the range of river management activities available and the good management practice in how they should be applied.

Instream works have the potential to affect aquatic and riparian habitat, aquatic species and morphological features. Greater Wellington Regional Council (GWRC) undertakes a range of instream works for flood protection, which are governed by a COP. Within the COP all potential effects are acknowledged and assessed to ensure all works are undertaken using good management practice. Good management practice means to plan, communicate, record, review all river works activities and to continually develop and improve methods to achieve improved outcomes for cultural and environmental values.

River management envelopes

The river management envelopes (design lines) within the western rivers have been reviewed following consultation on the draft FMP. There are some areas where the inner and outer management lines obviously do not match the current position of the river. These have been identified and updated in consultation with specific land owners.

A key project to be undertaken as part of implementing the FMP is to review the inner and outer management lines to ensure consistency along the various western river reaches. Where applicable, and if deemed necessary, modern geomorphology theory will be applied to envelope locations if there is value in doing so to address specific issues. This may include review of locations where the river envelope has not been performing in a way that is consistent with the use of riparian planted buffers as the primary management tool. To ensure ongoing relevance and consistency, it is proposed that the river management envelopes be reviewed every 20 years as part of a major FMP review.

Other management envelopes (bed level and pool/riffle/run) will be developed as an outcome of this FMP. Monitoring and analysis of river bed levels and gravel volumes will be ongoing as further specified in the final FMP.

Buffers

The main change to river management measures outlined in this FMP is to allow rivers to erode the western rivers' buffers from time to time, and to not always intervene urgently with works in the wet to "hold the line" to the inner management line. This shift represents a change in approach from frequent, small, reactive responses to less frequent but more often larger works.

Continued use of non-intrusive works such as dry river bed maintenance works and vegetation maintenance will carry on unchanged from past maintenance activities. In order to achieve this, most buffers should be established with dense vegetation in order to slow erosion. The implementation of this new approach is understood to deliver wider benefits to the river system and in turn, to the community.

To be effective, a buffer must be at or only slightly above riverbed level in order for the tree roots to hold the soil. After reaching maturity, willow trees can be "layered" against the bank edge to provide greater protection against erosion. The best sites (and high priority sites for buffer establishment) will be areas where the river has already eroded the buffer, or in some cases where the buffer is in farmland slightly above the riverbed.

This FMP acknowledges that in allowing the river room to move, this may result in an increase in sediment supply to the western rivers from bank erosion. However, due to the unpredictable nature of rivers, it is difficult to say for certain if an increase in erosion will occur. If an increase in erosion does occur the sediment source is likely to be areas in the lower reaches that have previously been artificially constrained. If additional sediment is introduced to the system, it is likely that the sediment will be deposited within the Lower Valley (after the confluence with the Waiohine, but before the coast).

Riparian planting across the entire buffer will be established by planting trees. This would involve willow poles being supported by mixed native vegetation where possible. This will either be on private land with the agreement of the landowner or on publicly- owned land.

High priority sites for riparian planted buffer establishment will be identified through the Operational Management Plans.

These sites will generally be:

- Where there is high erosion risk where regular in-stream works have been required to protect the edge; and
- Already eroded by the river; or
- Low farmland where riparian plants can be effectively established.

While these sites will be priorities for implementation, there will be an ongoing need to respond to flood behaviour and either reinstate or plant new areas of buffer. Over time, new areas of erosion will occur and create further opportunities. This will require acceptance from landowners that their land may be required for river space, meaning that this land may be allowed to erode back to, or close to, the edge of the river management envelope before physical intervention occurs.

On the other hand, there will be parts of the river management envelope that are low erosion risk. If these areas are high above the river then there is no benefit in installing dense vegetation. Buffer implementation will be driven in large part by flood events and the behaviour of the rivers.

Cliffs are a special case for buffer establishment. Unless there is an exception identified in the FMP or existing erosion control structure (scheme assets), the preferred use of riparian planting of buffers applies in these reaches too. In this case, the river managers will wait until the buffer has been eroded (or mostly eroded) down to river level before establishing riparian planting within the buffer at the toe of the cliff.

Areas where the buffer management method does not apply (instead relying on a higher level of mechanical intervention, or greater use of rock edge protection for example) are identified in the reach-specific approaches as described in Part 2.

The implementation of this changed river management approach will be gradual, taking place over decades. It is also not irreversible, although if unsuccessful, there could be a "re-investment" phase, and a significant reliance on in-stream works involved with regaining the control of river alignment that currently exists. Eroded topsoil would also take some time to re-establish.

An adaptive monitoring and management strategy will be developed to support the vision of this FMP. Measuring channel morphology over time, using drones or aerial photography and reporting changes using the Habitat Quality Index (HQI) will form part of the monitoring strategy. Other potential monitoring could include river cross sections, depth distributions, bank vegetation canopy and the calibre of floodplain trees. Some of these monitoring techniques are currently being undertaken, such as river cross sections.

GWRC has a number of existing monitoring regimes in place that can be collated to assist in assessing the effects of planting the buffers on the western rivers as well as stabilising the banks on the eastern rivers.

The implementation of these methods and particularly the planting of new buffer areas requires the support and agreement of landowners. Land purchase is allowed for in this FMP and will be pursued with landowners who prefer not to own the buffers under this change to the management regime. It is not proposed to compulsorily acquire land or use any other powers to compel landowners to establish vegetation on their land. However, landowners will not receive the full level of service (protection) to their land behind the buffer until a buffer is established to provide such protection.

Costs – riparian planting of the buffers

Costs associated with planting the buffers (western rivers) and eastern river banks have been estimated and include ground preparation, plants, planting and fencing (not that weed control is covered separately in Section 4.4.3). These costs will be largely covered by the operations and maintenance costs of flood protection in the Te Kāuru catchment. The responsibility of managing the riparian buffers will be shared between GWRC and with individual landowners. Other funding options will also be explored to supplement this, for example planting initiatives such as “1 Billion Trees” and “Trees that Count”.

GWRC will work with other planting initiatives and local nurseries to ensure that sufficient supply is available. We are aware that existing and new suppliers are looking to scale up production to meet anticipated demand in coming years.

The western rivers will have the whole buffer planted and then fenced (at the buffer boundary) to protect the plantings, whereas the eastern rivers do not have buffers so will instead have the crack willow removed and replaced with hybrid willows and/or natives within the riparian margin. Fencing costs relating to the eastern rivers will be explored with the landowners.

Within the western rivers there is a total of 876 hectares of buffer. Of the 876 hectares, 537 hectares or 61% are in pastoral land or vegetation less than 1.5m high and 338 hectares or 39% are currently vegetated. The eastern rivers, as stated above, will have willows planted along the river bank for erosion protection. It is estimated that the total length in kilometres of all three eastern rivers is 81km.

The estimated cost for planting is approximately \$625,000 per annum, over the life of the plan. As mentioned above, additional avenues for funding will be considered over this time.

Implementation – riparian planting of the buffers

Below is an outline of the planting implementation plan. Assuming that 40% of the buffer area is currently planted, targets for establishing riparian planting of buffers include:

- Year 10: 60% of the total buffer area to be in riparian vegetation
- Year 20: 80% of the total buffer area to be in riparian vegetation
- Year 40: 100 % of the total buffer area to be in riparian vegetation

Further on-site information will be required to develop a detailed plan. This process will be developed in the Operational Management Plans.

PLANTING IMPLEMENTATION PLAN

	YEAR	1	2	3	4	5	6	7	8	9	10	11-40
PHASE 1 - IDENTIFY HOTSPOTS												
Waipoua		█	█									
Waingawa		█	█									
Ruamāhanga - Mt Bruce			█	█								
Ruamāhanga - Te Ore Ore			█	█								
Ruamāhanga - Gladstone				█	█							
Kopuaranga				█	█							
Whangaehu					█	█						
Taueru						█	█					
PHASE 2 – WEED CONTROL SUPPORT FOR EXISTING RIPARIAN PLANTED BUFFERS												
PHASE 3 - LANDOWNER DISCUSSIONS AND SITE PREP												
PHASE 4 - PLANTING/FENCING OF HOTSPOTS. WEED CONTROL.												
PHASE 5 - LAND PURCHASE												
PHASE 6 - PLANTING/FENCING OF PURCHASED LAND. WEED CONTROL												
PHASE 7 - EVALUATION AND PRIORITISE ALL RIVERS												
PHASE 8 - COMMENCE PLANTING/FENCING/WEED CONTROL BALANCE												

Pest plant and animal management

This FMP outlines the following for implementation of management and funding responsibilities of pest control within the Te Kāuru catchment:

- Establish a riparian management officer position**

The job would consist of several responsibilities with a focus on the establishment and maintenance of riparian plantings within the buffer and ensuring that there is a coordinated approach to pest management within the buffers. Responsibilities could include managing the budget and distribution of traps and sprays for landowners to undertake their own pest management; assisting in the development of riparian management plans for buffers; coordination of community groups, volunteers etc who wish to assist with plantings and maintenance; and undertaking weed management on planted sites for up to two years post planting. Approximately \$60,000 per year would be required to establish this position which includes a salary and overheads.
- Provide assistance where required or requested for the management of weeds for two years after the buffer is planted. After two years it will be the responsibility of the landowner to manage the weeds.**

Responsibilities for weed control of planted buffers would sit with GWRC for the first two years post-planting and would be coordinated by the riparian management officer. Following this two-year period it would be expected that undertaking weed control would be the responsibility of landowners, with advice, provision of spray and assistance from community groups being coordinated by the riparian management officer. Training and certification would also be available for those who require or request spray (that do not already have it).
- Provide advice, traps, bait and bait stations for the management of pest animals**

Responsibility for the control of pest animals within planted buffers would sit with landowners. However, GWRC would provide advice on pest management, supply traps and bait stations to set-up when buffers are initially planted, and supply bait for the stations to landowners for up to two years post-planting.
- Budget for pest management of the Te Kāuru Buffers**

This budget would be split into two sections. The first section would cover the initial set-up cost of weed and pest control on recently planted buffers (placing traps and bait stations and pre and post planting spraying of weeds for two years). The second section of the budget would be an ongoing maintenance budget which would cover costs for providing landowners with spray, training for weed control, and bait for pest animal control (after the two-year maintenance period). The budget would vary from year to year depending on the percentage of new area planted each year. An annual budget of \$82,000 is allocated.

4.4.3 Planning and Policy

The most important planning and policy methods are the land use controls under the Wairarapa Combined District Plan (WCDP). These will be progressed in partnership with the District Councils either as a Plan Change or as part of the review of the WCDP.

A Strategic Land Purchase and Asset Retreat policy, and funding, is an important method for enabling the river management implementation described above.

4.4.4 Emergency Management

Emergency management measures will be implemented as described in Section 3.4. These are mainly actions to be taken by departments of GWRC working in partnership with WREMO.

4.4.5 Environmental Enhancement

The key environmental enhancement response is to develop and implement an Environmental Strategy. This will bring different agencies together with a plan and priorities for improvements to the river environments. A Community Support Officer and a Riparian Management Officer form an important part of implementing this, and GWRC will explore options for co-funding from different agencies to deliver environmental outcomes. It is expected that a small amount of increased cost will be involved in river maintenance activities to provide for better river amenities management.

4.4.6 General Responses

Below is a summary table of the general responses discussed throughout this FMP with an indication of priority and cost. These responses are more catchment wide and are therefore not covered in Part 2. Ongoing river management works costs are included in the table. Although we can't be certain, these are not expected to increase in the future as a result of the changes in operational approaches outlined in this FMP. Operational costs will be reviewed as part of assessing the success of the proposed changes when the FMP is reviewed. There will, however, be an increase in costs for flood and erosion protection associated with the additional outcomes of the FMP listed in the General Responses Summary (page 41) and the Major Project Response Summary (page 35).

GENERAL RESPONSES SUMMARY

ACTION	DESCRIPTION	SECTION REFERENCE	PRIORITY	COST	FUNDING
Ongoing river management work	Based on 2018 operational budgets	n/a	High	Approximately \$930,000 annually	GWRC operational expenditure
Develop bed level envelopes for Waipoua, Waingawa and Ruamāhanga Rivers	A bed envelope with guidance on how to respond to areas of degradation (bed is dropping) and aggradation (bed is filling in)	3.2.3	High	\$200,000	GWRC operational expenditure
Develop pool, run and riffle envelopes	Upper and lower envelopes for pool/riffle/run sequences in different river reaches – to be used in planning programmed physical works	3.2.8	High	\$50,000	GWRC operational expenditure
Riparian planting of buffers	Planting of the full buffer area of the Te Kāuru catchment, including ground preparation, plants, planting and fencing	3.2.5	High	\$625,000 per annum	GWRC operational expenditure
Wairarapa Combined District Plan Review	Developing flood mapping and contributing policy advice for input to District Plan review. New designations for Major Projects.	3.3	High	\$200,000	GWRC loan-funded expenditure
Develop Environmental Strategy	A strategy and action plan for specific enhancements in the river environments – multi agency	3.5.1	High	\$200,000	GWRC loan-funded expenditure
New governance and funding structures	Establish new governance structures and funding approaches required to implement this FMP. May require changes to Council policies and/or to be implemented via Long Term Plan.	4.1 and 4.3	High	\$50,000	GWRC operational expenditure
Design lines review	Review outer and inner design lines in line with operational experience and any new information	4.4.2	High	\$200,000	GWRC operational expenditure
Pest plant and animal management	Budget set aside to assist with the establishment and ongoing management of pest animal and plant control.	4.4.2	High	\$82,500 per annum	GWRC operational expenditure
Operational expenditure	An agreed and understood framework for how works will be prioritised following a major flood, and how this relates to normal scheme governance arrangements	3.3.5	Medium	\$30,000	GWRC operational expenditure
Strategic land purchase and asset retreat	Funding available for purchase of land for FMP implementation – for buffer establishment, future major projects, environmental strategy implementation, etc. Also, for GWRC contribution to retreating public assets out of the buffer when this is a suitable alternative to protecting them in place. Criteria to be developed.	3.3.8	Medium	\$5M	GWRC loan-funded expenditure
Riparian management officer	Potential part time resource to assist in the establishment and management of riparian planting the entire buffer	3.5.3	Medium	\$60,000 per annum ongoing	GWRC operational expenditure
Emergency management and flood warning improvements	Collaboration with WREMO on emergency management planning. Technical advice and support to WREMO including new mapping. New flood warning infrastructure such as additional rain gauge or flow monitoring sites.	3.4	Medium	\$100,000	GWRC loan-funded expenditure for infrastructure upgrades
Community support officer	Potential part- or fulltime resource to establish/support community groups and help to deliver environmental/recreational/cultural outcomes	3.5.2	Low	\$60,000 per annum ongoing	GWRC operational expenditure, seeking partner support
Major review of FMP	Formal review of FMP performance	4.4.7	Low	\$300,000	GWRC operational expenditure

4.4.7 Monitoring and Review

Ongoing monitoring of the aims and objectives of the FMP will enable the outcomes to be regularly reviewed. The FMP will be a living document so regular review means that the floodplain management planning process, and flood hazard mitigation measures, can be updated and changed where the need arises. Outcomes of the FMP will be largely implemented through river management activities authorised through resource consents. Both the resource consents, and the associated Code of Practice, include adaptive management processes where by improvements can occur as new information and techniques become available. The consents and the Code of Practice are both mandated through a statutory process.

An outline of the monitoring plan for the implementation of the buffers is included in Section 4.4.2.

A comprehensive review of the final FMP will be undertaken every 20 years, or earlier if the flood hazard is significantly altered by flooding, earthquakes or new information. A review could also be triggered by major regulatory or resource consent changes.

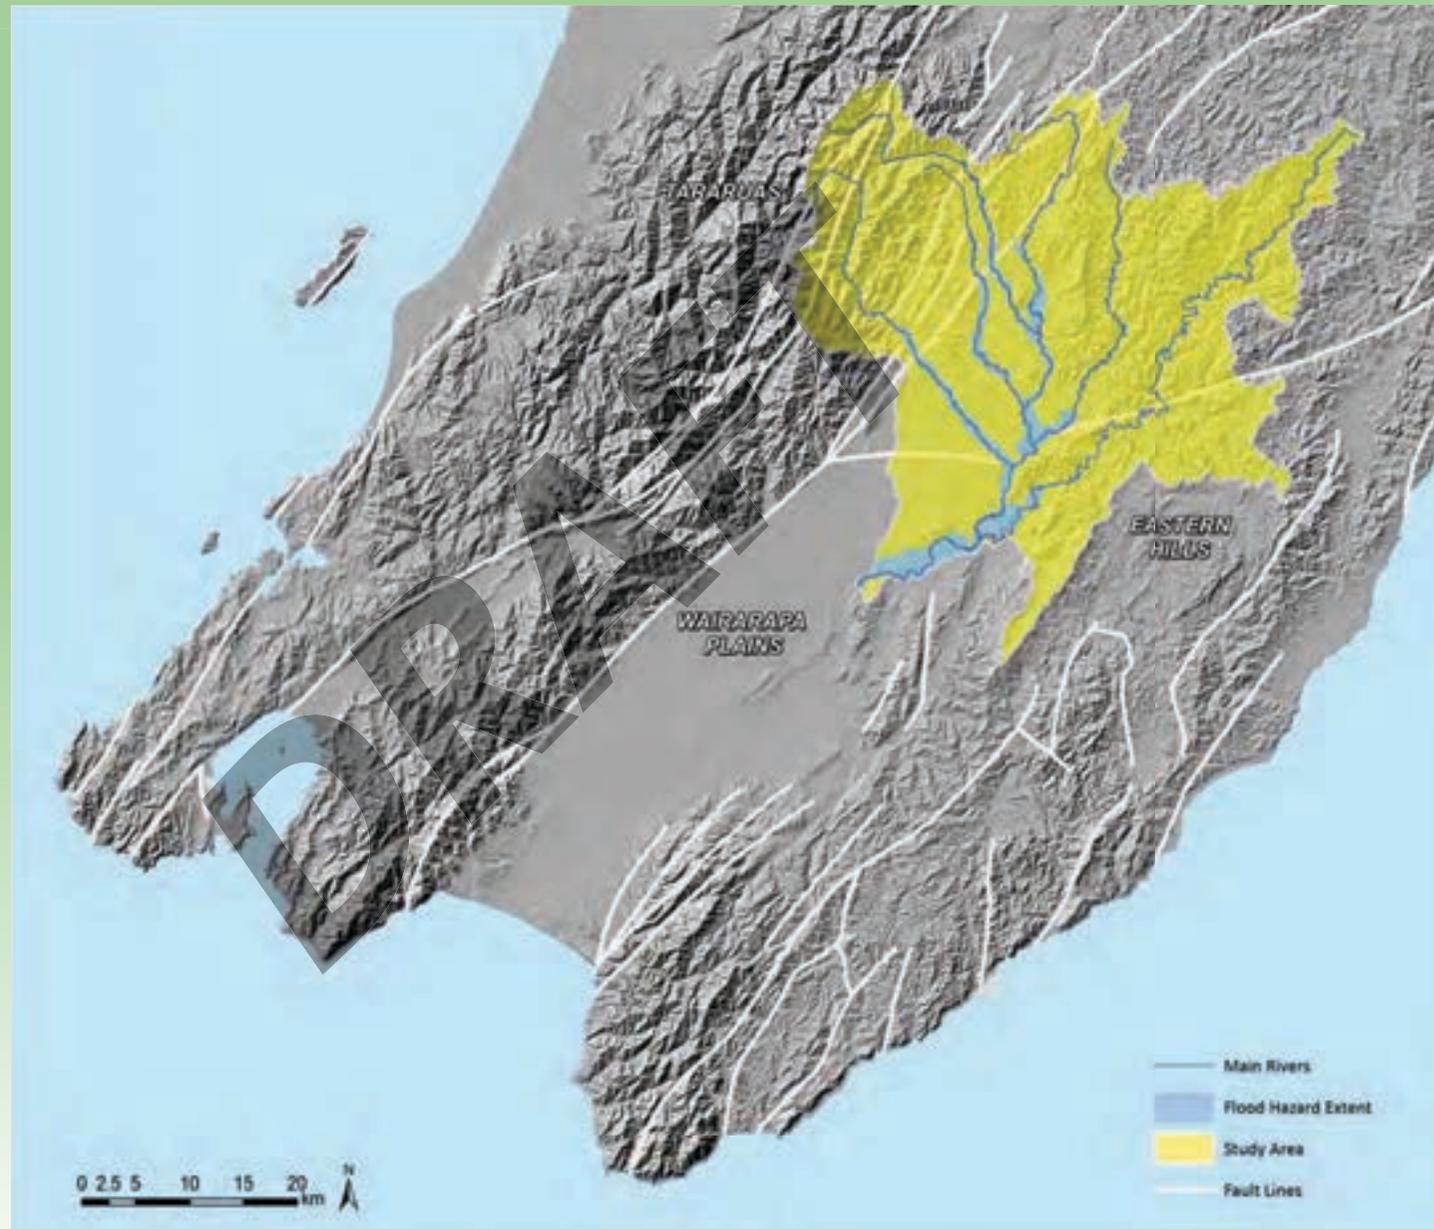

Operational Management Plans (providing more detail on how the FMP will be implemented operationally over five to ten-year horizons) will be completed and reviewed on a more frequent basis. Minor reviews will also be done yearly through the Regional Council's annual plan process. The comprehensive review would involve re-modelling of the flood hazard to ensure that information was accurate.

The table following summarises what will be reviewed and when.

REVIEW TIMEFRAME	REVIEW SCOPE	REPORT ON WHAT?
ANNUAL	<ul style="list-style-type: none"> Implementation programme Operational programme summary 	<ul style="list-style-type: none"> What was proposed What work was done Why the difference Proposals for next year Summary of implementation status
EVERY 3 YEARS (TO FEED INTO GWRC/CDC/ MDC LONG TERM PLANS)	<ul style="list-style-type: none"> Implementation progress Priority and costs of major projects and operational expenditure Alignment between different agencies on projects and funding 	<ul style="list-style-type: none"> Investment priorities Staging / speed of implementation Risks and opportunities
INITIAL 10-YEAR REVIEW	<ul style="list-style-type: none"> An assessment that key aspects of implementation are on track and a formal report to the Advisory Committee and Wairarapa Committee incorporating external feedback as appropriate Incorporate changes or new information due to other plans external to the FMP 	<ul style="list-style-type: none"> Review progress on delivering all high priority major projects Review how Operational Management Plan process has performed Review how design envelope and buffer approach has performed, and degree of success in implementing it Incorporate any changes required due to: <ul style="list-style-type: none"> Resource consenting outcomes Waiohine and Lower Wairarapa Valley Floodplain Management Plans Whaitua/Natural Resources Plan outcomes Wairarapa Moana treaty settlement outcomes
EVERY 20 YEARS – MAJOR REVIEW	<p>Scope to be agreed with iwi and stakeholders. Expected to include:</p> <ul style="list-style-type: none"> Effectiveness/progress of all common methods and general responses Progress in implementing major project responses, and what has been achieved (e.g. flood damages saved) Appropriateness of governance structure and funding approach Review of catchment hydrology and flood extents River bed envelopes and river edge envelopes/design lines Learnings from major flood events Future budgets proposed – affordability, value and sufficiency Reprioritising and costing all outstanding works. 	<p>To GWRC, MDC, CDC and the Wairarapa River Management Advisory Committee as a standalone report and updated FMP following consultation with stakeholders.</p>

DRAFT

PART 2: LOCATION SPECIFIC VALUES, ISSUES AND RESPONSES

5. Overview and Regional Context

This part of the Te Kāuru Upper Ruamāhanga Flood Management Plan (FMP) sets out the spatial flood management plan outcomes to be delivered across the Upper Ruamāhanga catchment. This should be read in conjunction with Part 1 of the FMP which sets out the background and overview of the FMP including implementation and responsibilities.

The six rivers which make up the Upper Ruamāhanga catchment have been divided into 20 separate reaches (17 for the western gravel bed reaches, as well as the three eastern silt bed rivers) for the purpose of directing floodplain management responses. These are also set within the broader catchment and regional context introduced at the beginning of this document. Each reach is then described in terms of the following, reflecting a summary of the findings of the phases of the FMP development process:

- The character and values that exist within each reach, including upstream or downstream influences
- The identified flood and erosion issues to be addressed
- The reach specific flood and erosion responses, including major project responses where relevant

The eastern rivers have been amalgamated for the purpose of defining floodplain management responses, given the similar attributes and outcomes which are shared across this area of the catchment.

5.1 Wairarapa Valley

The Wairarapa Valley is situated in the Wellington Region at the southern end of Te Ika a Maui, the North Island of New Zealand. It has a temperate climate with distinct seasonal variations. It is known for having relatively stable weather patterns, commonly experiencing long hot relatively dry summers and mild winters.

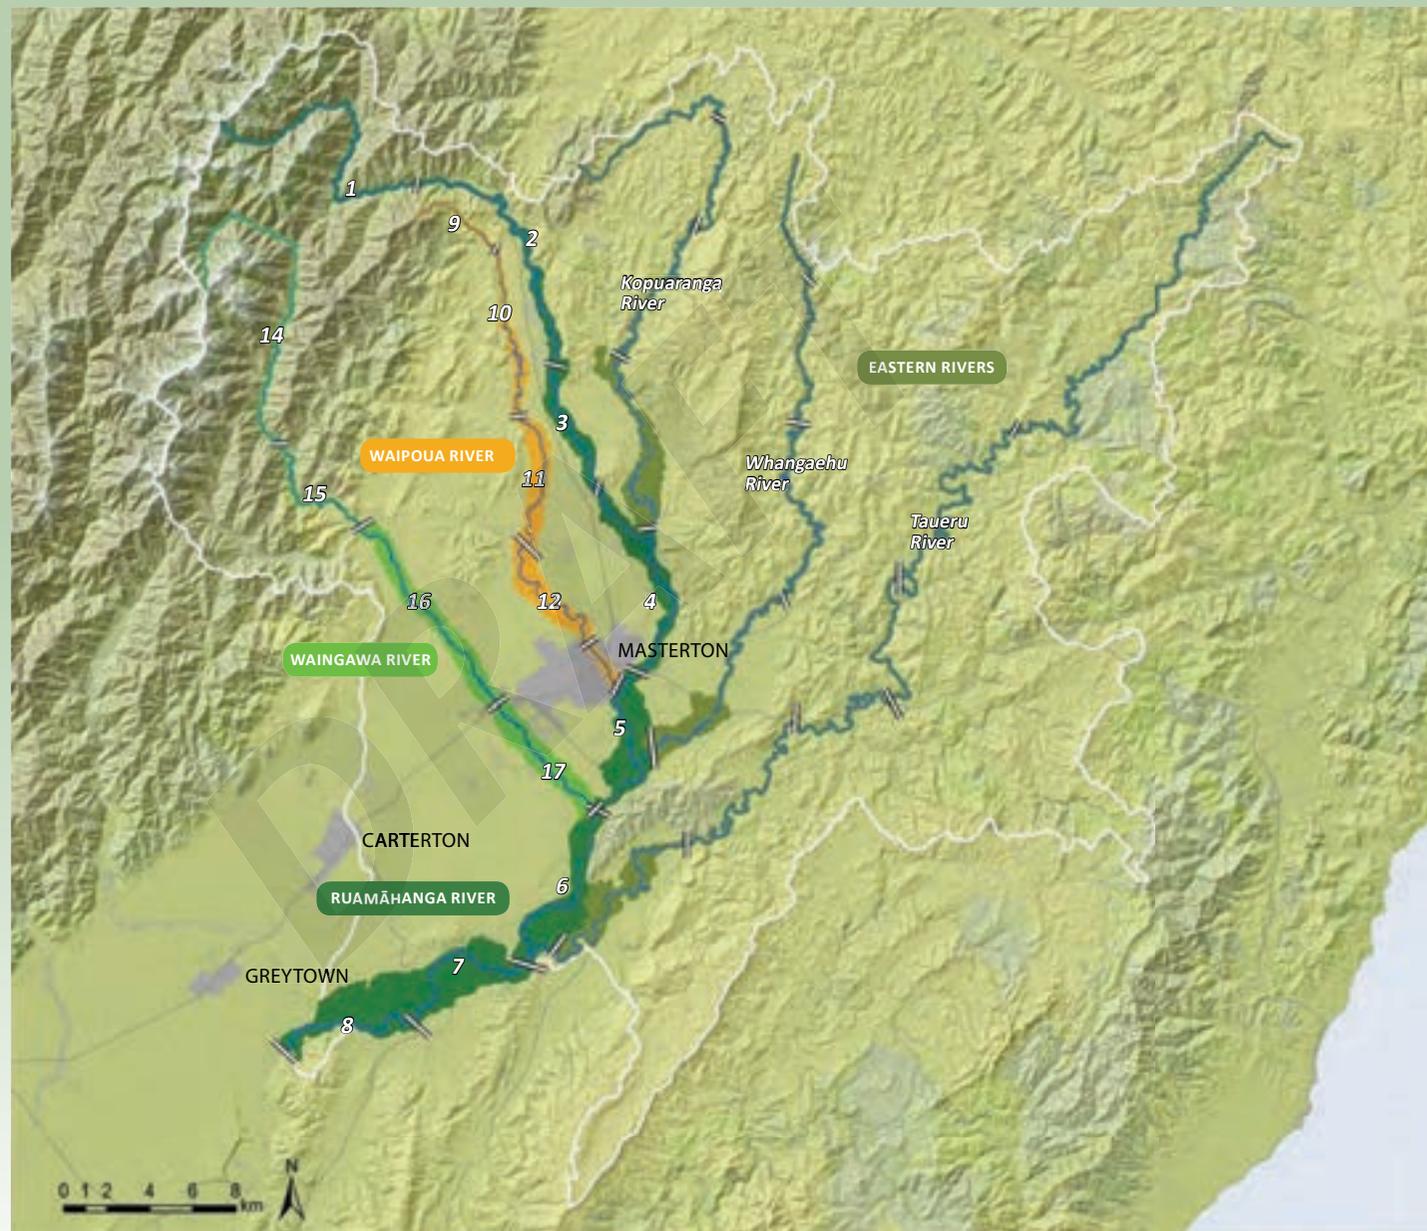

The Wairarapa Valley is made up of: the western Tararua Ranges – formed of greywacke rock of varying ages; the Wairarapa Plains – formed from deposited alluvial gravels and silts; and the eastern hills – formed from deposited marine sediments. The geology of the area is dominated by the underlying active boundary between the Pacific and Australian plates, which have created extensive faulting throughout the valley, predominantly on a north-east/south-west alignment. The largest recorded fault movement occurred in the 1855 Wairarapa magnitude 8.3 earthquake, causing a 13 metre horizontal movement and significant changes to the plains and river systems. These geological and climatic characteristics of the Wairarapa are reflected through the rivers – contrasting between the high energy, gravel bed western rivers and the sluggish, generally soft sediment bed eastern rivers.

Humans have had an influence on floodplain and channel form characteristics in the Wairarapa since early settlement, and it is suggested that the impact of Western civilisation came at a time when the indigenous vegetation was already in a state of flux. Considerable areas of land were cleared through burning in the first few centuries of Māori settlement and the extent of cleared land increased after the arrival of Europeans.

Early observers estimated that around 200,000 acres of the Wairarapa was grassland, 80,000 acres of forest, 25,000 acres of fern and scrub, and 20,000 acres of swamp. The large areas of natural grassland and the close proximity to Wellington made the Wairarapa an attractive area for farming, and this saw the first sheep station in New Zealand being started in 1844. At the time, the land along the Ruamāhanga River was covered with dense bush, and detailed surveys of the Waingawa River from 1900 show native scrub coverage of the banks and islands.

Farming continued to develop, and the introduction of further exotic species – deer, pigs, and possums – continued a trend of deforestation, exposing further areas of the ranges to natural erosive forces. This would, over time, be seen to have impacts on raising the levels of river beds across the plains. European settlers introduced the use of willows as an early bank erosion and flood protection tool to address some of these impacts. With further population increases, more detailed and varied methods were developed to protect both farmland and homes. These included the use of stopbanks, river diversions, improved willow works, reforestation, and exotic pest control.

Rainfall patterns in the catchment are dominated by the Tararua Ranges. These create a relatively dry plains area (800mm average annual rainfall) with a significant increase in rainfall in the mountains (6000mm average annual rainfall).

Upper Ruamāhanga Catchment

5.2 Rivers and Settlement within the Upper Ruamāhanga Catchment

The Ruamāhanga is the river into which almost all other rivers in the Wairarapa Valley eventually flow. It connects the Tararua to Wairarapa Moana, eventually flowing from there into Raukawa Moana / Palliser Bay. The Upper Ruamāhanga catchment extends from the Tararua Ranges to the confluence with the Waiohine River, covering an area of 1,560 square kilometres through which the Waipoua, Waingawa, Whangaehu, Kopuaranga and Taueru (Tauweru) rivers and their tributaries flow.

The western rivers emerging from the rugged Tararua Ranges are well known for their pristine environments near the headwaters and as a result they are much valued for their beauty, mauri, recreational opportunities and spiritual significance. The eastern tributary landform is characterised by undulating hills which are today dominated by agricultural use. However, there remains a strong cultural significance within and around these eastern rivers for Tangata Whenua, and they are popular in some areas for recreational pursuits.

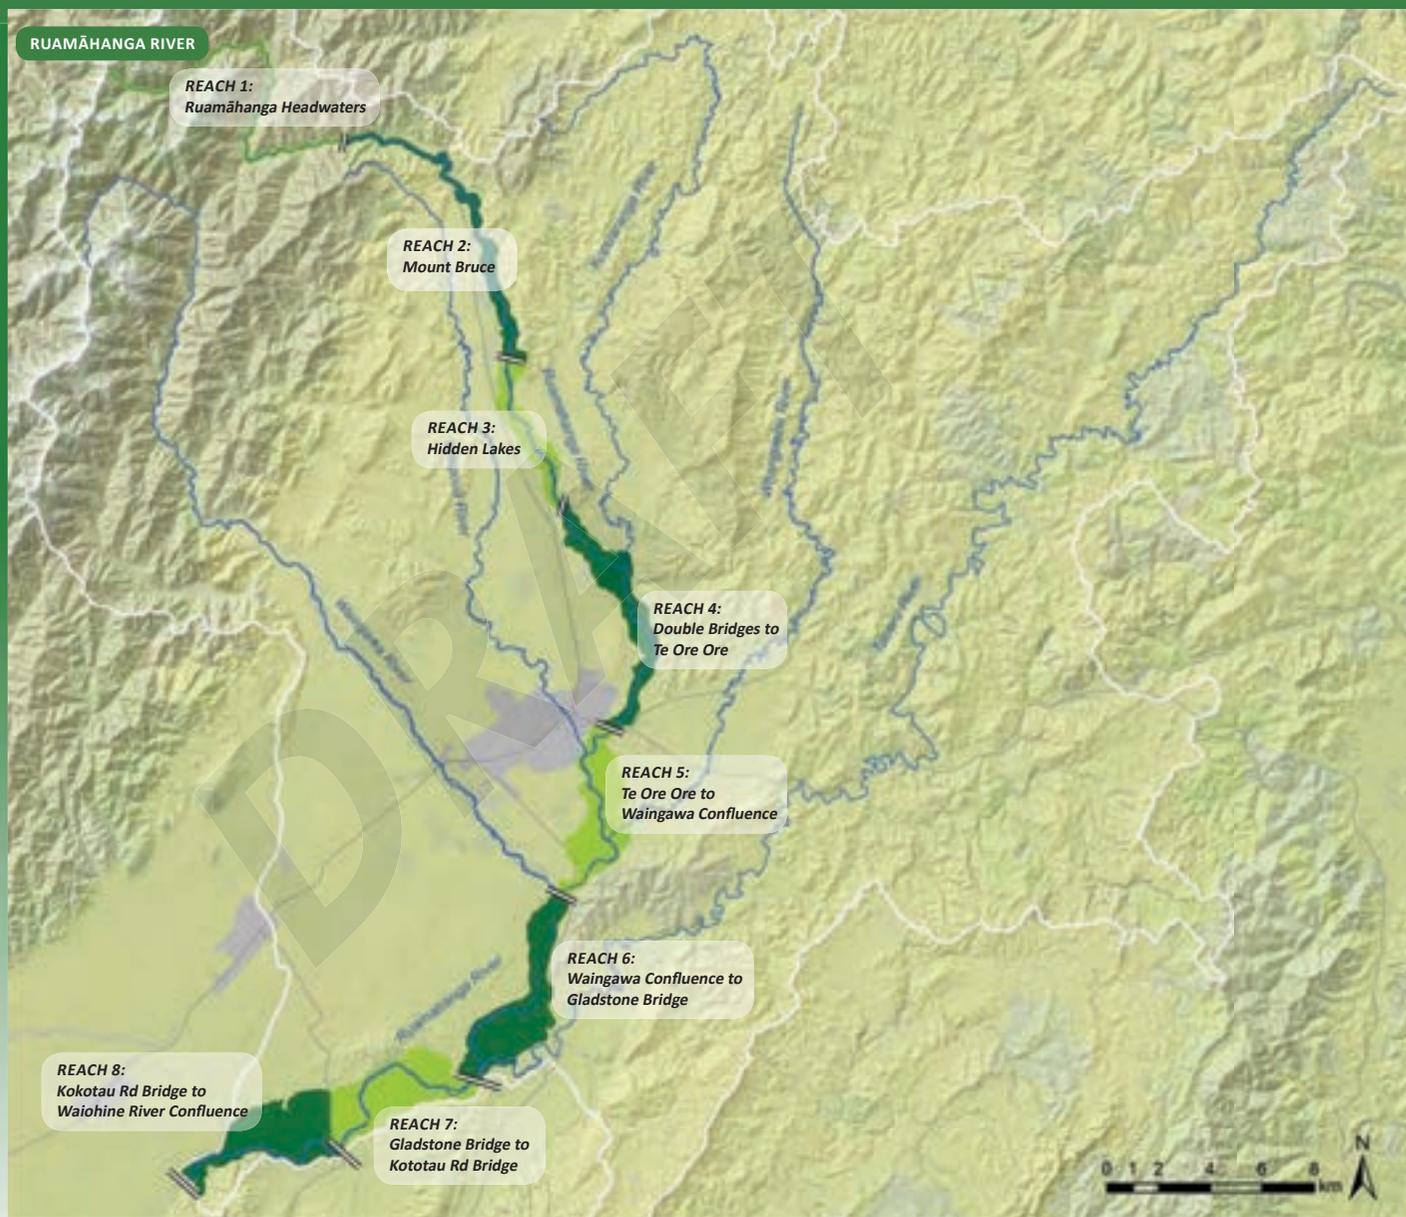

Both the western and eastern tributaries run out onto the fertile Wairarapa Plains which have been formed over time through deposition of alluvial material, including greywacke alluvium from the Tararua Ranges and alluvial silts and sands eroded from a mixture of mudstones, sandstones and limestones which form the Eastern Wairarapa Hills. The land-use of the catchment is dominated by native forest in the upper Tararua Ranges, which transitions into a range of primary production activities (plantation forestry, dry stock grazing, dairying, and cropping), rural lifestyle development, and urban areas on the floodplain.

Tangata Whenua have a long-standing connection spanning many generations with the Ruamāhanga River and all of its tributaries. Both Ngāti Kahungunu ki Wairarapa and Rangitāne o Wairarapa currently share in the role of kaitiaki for these catchments.

While non-Māori have been present in the Wairarapa for a shorter period, over several generations they also have developed strong ties to the land and landforms. Some of the families were present on the first European settler ships, and they have made their mark on the modern social, political and physical landscape through recurrent involvement in the ongoing development changes in the Wairarapa.

Today the Wairarapa has a distinct identity. It has both a legacy of, and a future rich with, cultural significance to Māori. With strong agricultural roots – the leading industry in the area – it is also noted for the quality of its landscape and associated recreational opportunities, and its hosting of a number of regional events and concerts. Home to some 40,000 residents, the Wairarapa has produced or become home to more than a representative share of well-known ambassadors ranging from noted scientists and engineers to popular musicians and film directors.

All rivers of the catchment have a diverse range of values attributed to them, and as generations come and go the emphasis on these values shifts in response to the culture of the people who value them.

Ruamāhanga River

6. Ruamāhanga River

The Ruamāhanga flows from its source in the Tararua Ranges down through steep mountainous terrain and native forests, running through rock-lined gorges and boulder garden rapids before leaving the foothills close to Pukaha / Mount Bruce. From there, it flows through a number of steep-sided gorges where historic river terracing can be seen through the fringes of patchy native and exotic vegetation, before opening out into the pastoral Wairarapa Plains. Here it turns to a more southerly direction flowing downstream through confluences with all of the other rivers which flow through the Wairarapa valley.

The Ruamāhanga is the most significant ancestral river of Wairarapa mana whenua. Its name is attributed to a number of stories relating to its translation of 'Rua' meaning two and 'Māhanga' meaning twins, forks or snare trap. One story is that the translation of two-forks refers to the east/west alternating confluences along its length as it travels from north to south. Another is that its name was given by Haunui-a-Nanaia who caught two birds in a snare trap on the banks of the river.

The main river channel from the State Highway 2 Bridge near Mount Bruce downstream to the Waiohine confluence extends some 58 km. This is characterised by a semi-braided form in its upper reaches and changes to a managed single thread following a gravel corridor in the lower reaches (approximately at Te Ore Ore).

Different soil types have developed at various locations on the floodplain depending on the rate of flood deposition, the source of material, time since deposition, and natural drainage. The natural fertility and erodibility of these soils is quite variable. Inappropriate land-use and lack of shelter may cause wind erosion.

Land use in the catchment includes native forest in the upper catchment within the Tararua Ranges, which transitions to a range of primary production activities (dairying, dry stock grazing, cropping, and plantation forestry), rural lifestyle development, and urban areas (Masterton) on the floodplain.

The Ruamāhanga River has many significant wāhi tapu and archaeological sites associated with its waters and banks, which include urupa, pa, kainga, and middens. Several of the archaeological sites are recorded with the New Zealand Archaeological Association (NZAA) and some urupa also have a registered title.

Key recreational activities include hill walking; wilderness fishing in the Tararua Ranges; jet boating below confluence with the Waingawa River; and kayaking. The Ruamāhanga is also well known for its good quality swimming holes and gravel beaches suitable for summer picnics.

The Ruamāhanga River is an important ecological corridor including nesting sites for birds, habitat and migratory trout for both native and exotic fish species. It is also becoming nationally important for threatened bird life. In recent years it has been recorded as bucking the national trend of decline in black billed gull species, and supports populations of black fronted dotterel, pied stilts, black shags and NZ pipit. The current river managers have worked over the past decade to improve their management techniques to lessen harm to the habitats of these species, with positive impacts on the bird populations.

Within the project extent, 26 different species of fish have been identified, and at some point each of these would have lived in or passed through the Ruamāhanga River. Over half of the 20 species of native fish found within the Te Kāuru Upper Ruamāhanga catchment are considered to be "at risk", meaning that their population nationwide is considered to be declining. The associated restoration of the Wairarapa eel (tuna) fishery is of particular significance to Māori.

General Issues

The Ruamāhanga River is well known to the Wairarapa community for its flood flows. The relatively entrenched upper reaches of the Ruamāhanga River contain much of the flood water, confining it between old river terraces, and its passage is controlled in several locations by prominent rocky outcrops. As it turns to the south at its confluence with the Kopuaranga River it opens into a broader floodplain, and the modelled flood events show a greater extent of the adjacent land under water. This trend of a broadening floodplain continues to its confluence with the Waiohine River.

The flooding of the Ruamāhanga River also strongly influences the flooding in each of its tributaries. If a flood event occurs in the Ruamāhanga River at the same time as any of the tributary rivers, much higher flood levels are experienced in the tributary.

There are several sites of particular concern in relation to erosion risk. These include the banks of the river adjacent to Hidden Lakes and the areas around Henley Lakes and eastern Masterton, both of which are protected by substantial erosion protection works. Flood protection work has recently been upgraded to protect the Masterton Wastewater Treatment Plant. There is also a former Masterton landfill site and several stock bridges and structures related to farming activities along the length of the river at potential erosion risk.

General issues relating to the Upper Ruamāhanga River include:

- lateral erosion of the river banks occurring due to natural processes in the river such as meandering of the channel, degradation and aggradation of the river bed. The stability of river banks can be compromised by degradation or can be affected by additional erosion pressure as the river tries to wind its way around aggradated islands in the middle of the channel
- reduced channel capacity to carry flood waters due to aggradation occurring, generally in the lower reaches
- invasive introduced vegetation species including yellow lupin, tree lucerne, broom and crack willow that dominate in channel areas leading to flood flow obstruction
- threats to existing planted vegetation, predominantly willow buffers from 'old man's beard' and other plant, animal and insect pests that attack the species
- numerous private water intakes from the river channel that require protection to ensure water supply
- the river being restricted within the design lines, creating additional erosion pressure and reduced flood capacity
- the value of the rivers for recreation and habitat at times conflicting with river management works.

Ruamāhanga Headwaters – Reach 1

Character

The upper reaches of the Ruamāhanga River flow through Tararua Forest Park. The river follows a narrow gravel-choked valley surrounded by steep bush-clad mountainous terrain. Much of the headwaters of the Upper Ruamāhanga are in a natural state with pools and rapids enclosed by diverse areas of native vegetation.

Key Characteristics

Narrow gravel valleys with boulder gardens and pools

Predominant cover of native vegetation along margins

Wilderness recreation opportunities

Values

The headwaters of the Upper Ruamāhanga are protected as part of the Department of Conservation (DoC) Estate which provides the setting for wilderness experiences. Overall the landscape has very low levels of landscape modification with corresponding very high scenic value. The entirety of this reach is zoned Rural (Conservation) in the Wairarapa Combined District Plan (WCDDP, 2013).

Due to the strong underlying wilderness and scenic values, this reach contains popular walking and tramping tracks with huts leading into the Tararua Ranges. Wilderness fishing is popular, with some grade 2+ kayaking also occurring through boulder gardens and sharp ends. All recreation access is limited to foot access only.

Substantial ecological values have been identified along this reach in association with its underlying conservation value. This includes terrestrial habitats associated with fenced indigenous forest, mixed exotic-indigenous forest, indigenous treeland, stonefield and boulderfield.

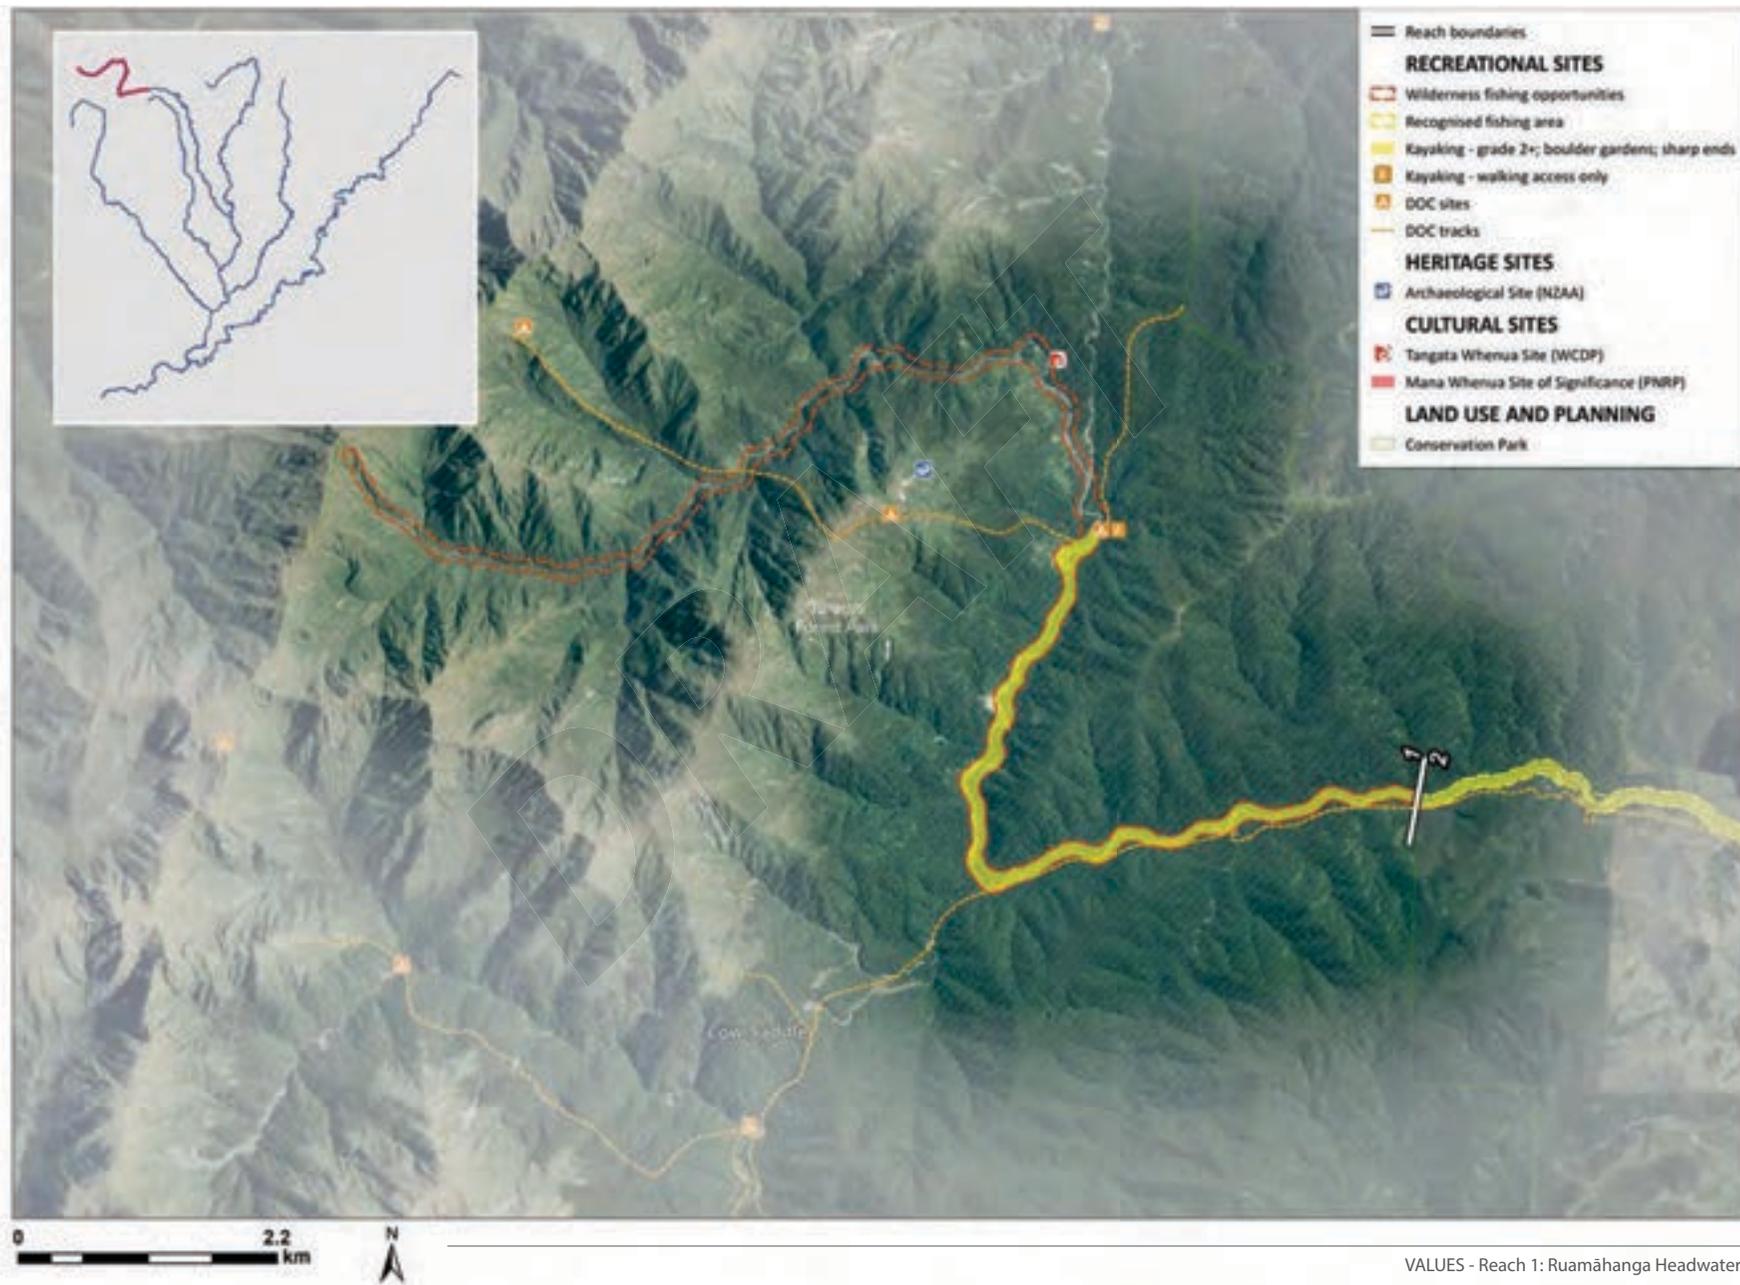

Waahi tapu has been identified in this area with the headwaters providing an important cultural connection to the Tararua Ranges.

Key Floodplain Management Points

- Encourage continued recognition of the values and character of this reach
- Support initiatives that aim to preserve or improve the natural values of this reach

There is no intent to carry out any maintenance activity within this reach as part of the Floodplain Management Plan. There are no specific flood and erosion issues identified for this reach.

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES
LANDSCAPE MODIFICATION	SCENIC VALUE					
Very Low	Very High	Walking tracks and huts (DOC), angler access, kayak access (foot only), kayaking, wilderness fishing	-	Sacred place, waahi tapu; stopover camp, puni; waahi whakawaatera	Rural (Conservation), Road, River.	Fenced indigenous forest, Mixed exotic-indigenous forest, Indigenous treeland, Stonefield and boulderfield

VALUES - Reach 1: Ruamāhanga Headwaters

Mount Bruce – Reach 2

Character

This reach flows from the base of the Tararua Forest Park south of Mount Bruce (Pukaha) into the Upper Ruamāhanga Plains. In this area, the river remains partially contained within the semi enclosed flat valley floor which follows the base of the Tararua Ranges. The formative influence of the river remains clearly apparent along adjacent terraces aligned in a north-south direction beyond the main channel of the river.

In the upper section of this reach, the river passes through a series of gorges in the vicinity of Mount Bruce Bridge. Below this, much of the river settles into a series of pools, runs and riffles with narrow braids. The margins of the river are predominantly enclosed by mixed native and exotic vegetation which separates the river from adjoining farmland. A more significant area of podocarp forest is also apparent at Dunvegan Forest on the western banks.

Key Characteristics

Steep rock lined gorges containing boulders, pools and rapids

Distinct river terraces stepping down to the river corridor

Mixed exotic and remnant native vegetation

Key Floodplain Management Points

- Protect the Dunvegan Forest RAP site from negative impacts of flooding and erosion

Values

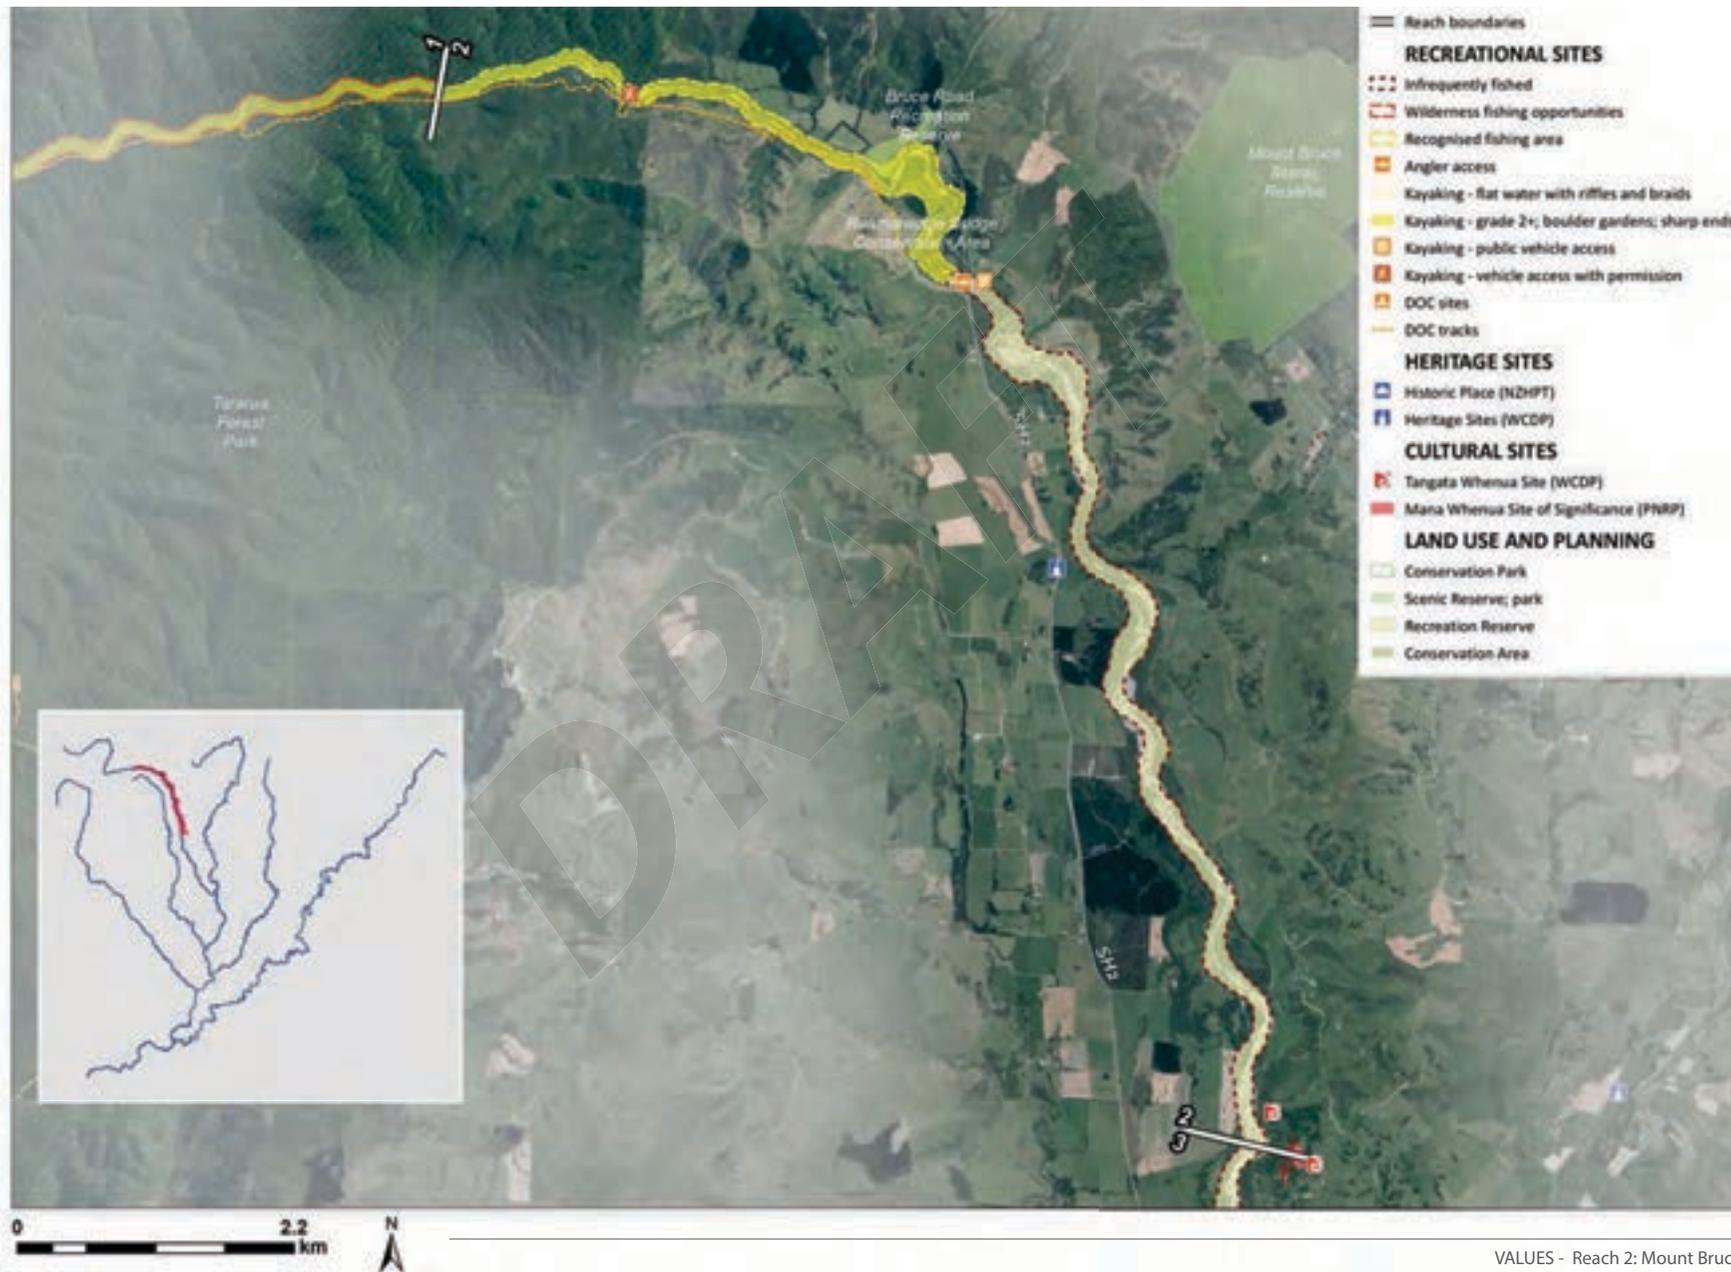

This reach of the river is slightly more modified than the headwaters of the Ruamāhanga, with much of the surrounding landscape used for primary production. Whilst parts of the reach continue through gorges surrounded by indigenous vegetation. The presence of exotic scrub and State Highway 2 also influence its character and values. Overall it has a low level of modification and corresponding high scenic value.

The upper parts of this reach contain popular walking, fishing and kayaking areas accessed from Mount Bruce Bridge and connecting with Tararua Forest Park. South of Mount Bruce Bridge, the presence of flat water with riffles and braids means the area is valued for kayaking, although this area is infrequently fished.

Several important ecological values have been identified along this reach including a Recommended Area for Protection (RAP) encompassing remnant indigenous vegetation at Dunvegan Forest and terrestrial habitats associated with fenced indigenous forest, unfenced indigenous forest, mixed exotic-indigenous forest, indigenous treeland, stonefield, boulderfield, natural wetlands and ponds.

There are numerous sites of cultural importance including waahi tapu, an historic village, pā, and waka landing sites.

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES
LANDSCAPE MODIFICATION	SCENIC VALUE					
Low	High	Walking tracks (DOC), angler access, kayak access, fishing, kayaking	Old Settler's Cottage (WCDP)	Tangata whenua site (WCDP), Waahi Tapu, historic village site, historic pā site, historic waka landing site	Rural (Conservation), Rural (Primary Production), Rural (Special), Road, River, State Highway.	Dunvegan Forest Remnants (RAP), Fenced indigenous forest, Unfenced indigenous forest, Mixed exotic-indigenous forest, Indigenous treeland, Stonefield and boulderfield, Natural wetlands and ponds

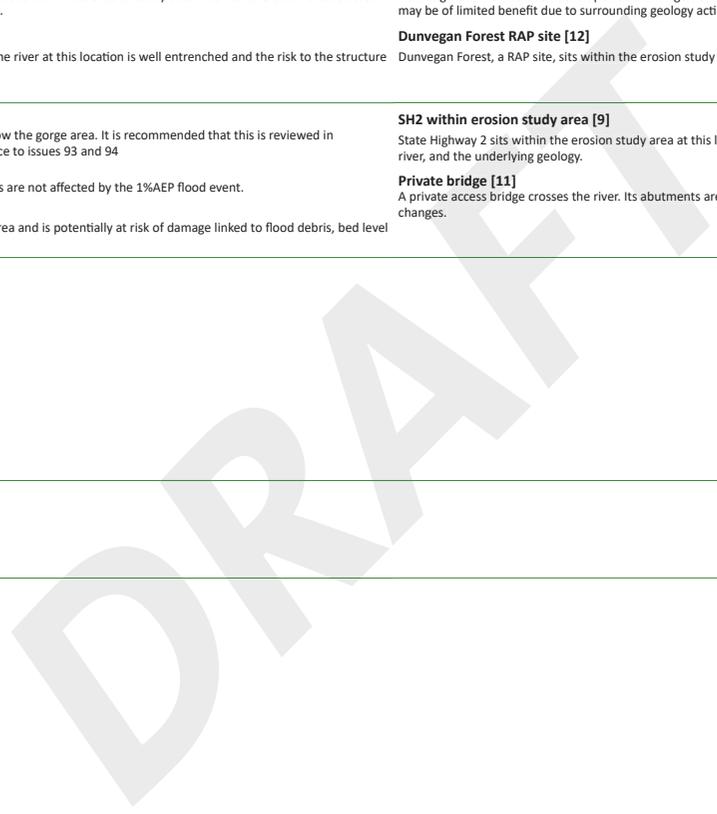

VALUES - Reach 2: Mount Bruce

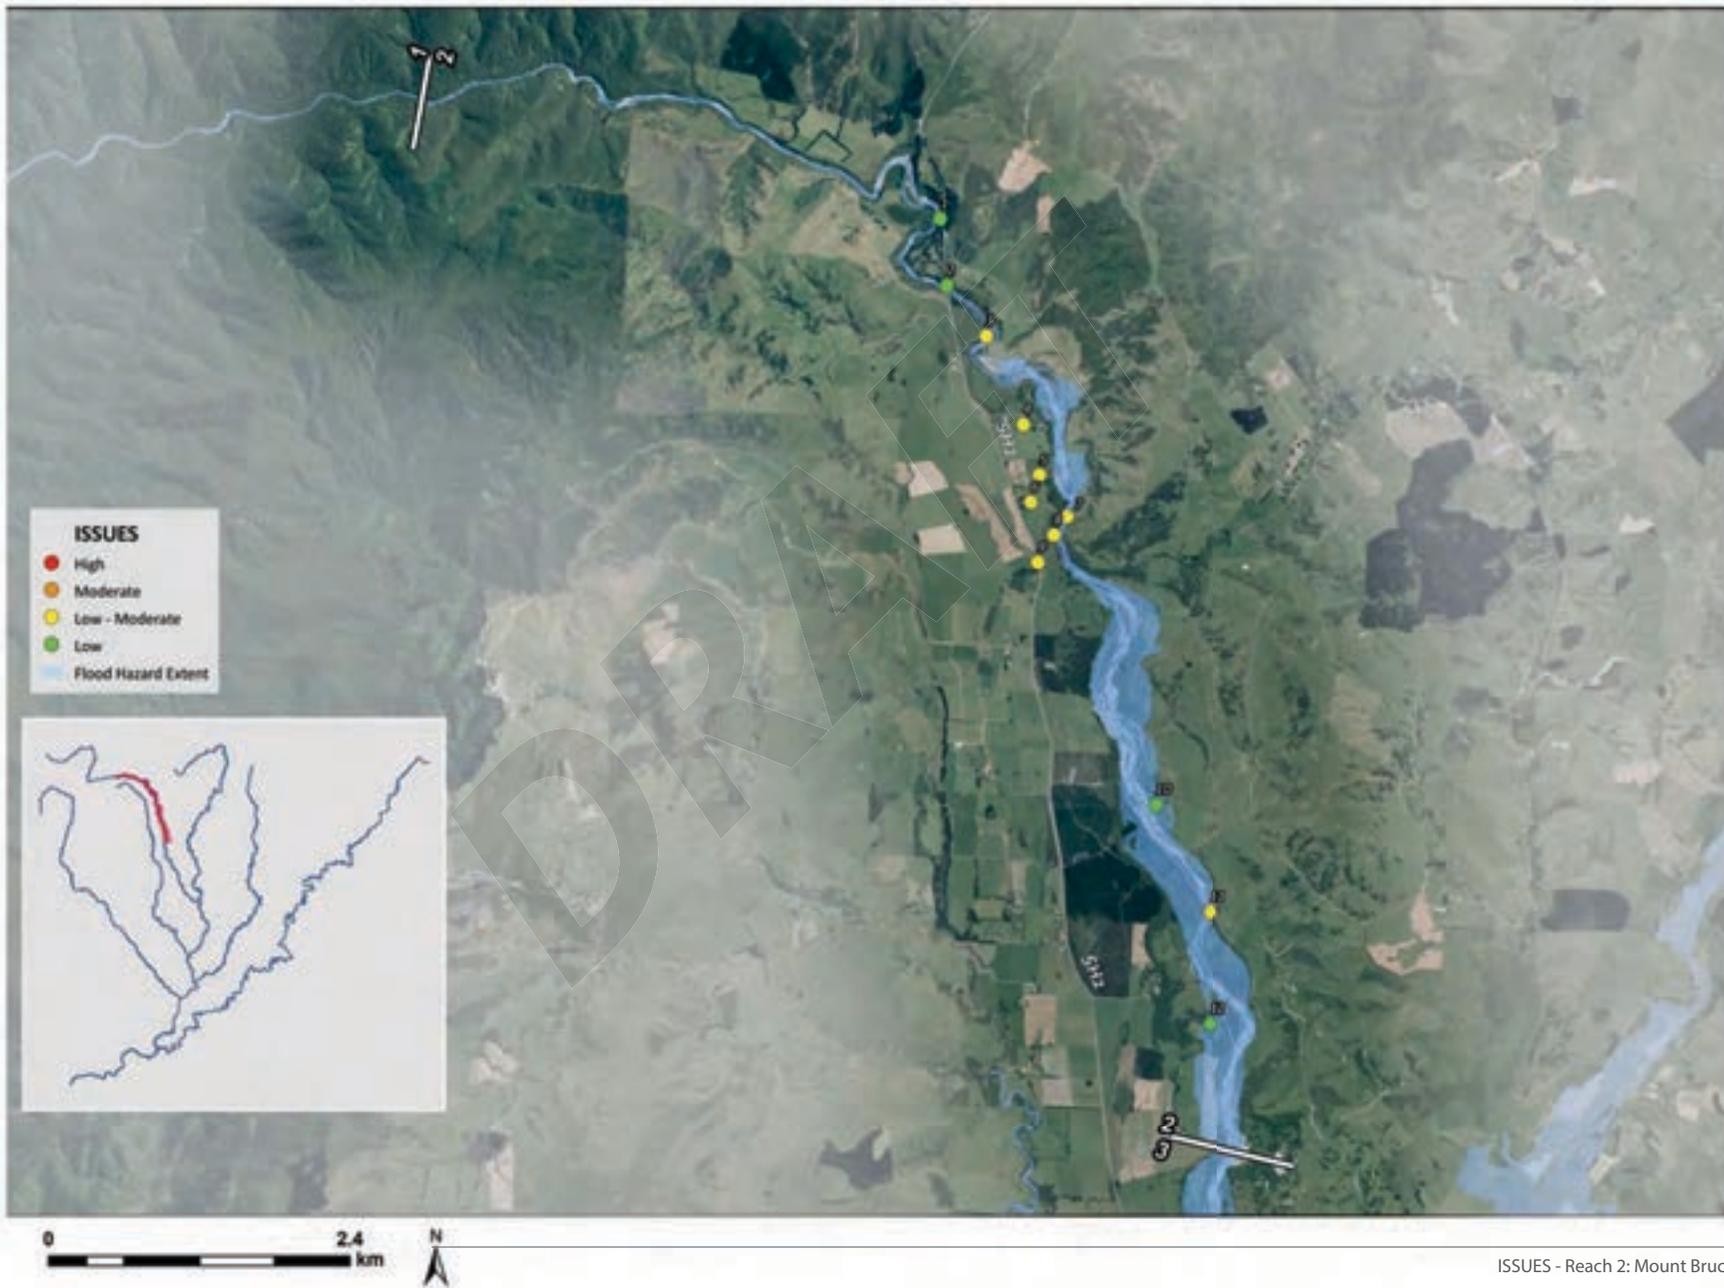

Mount Bruce – Reach 2

Flood and erosion issues

A total of 12 flood and erosion issues have been identified along this reach. Issues have been ranked according to their consequence and likelihood (i.e. risk) and assigned an ID number [xx].

LOW	<p>State Highway 2 [1] State Highway 2 runs close to a gorge section of the Ruamāhanga, and sits within the erosion study area. The risk of erosion is considered low due to the natural rock formation which controls the erosion risk.</p> <p>State Highway 2 Bridge [2] The abutments of the SH2 bridge sit within the erosion study area. The river at this location is well entrenched and the risk to the structure from erosion is considered to be low.</p>	<p>No defined design channel [10] No design channel has been developed as a management tool upstream of this location. This provides less certainty for adjacent landowners, however it may be of limited benefit due to surrounding geology acting as a natural control on the river.</p> <p>Dunvegan Forest RAP site [12] Dunvegan Forest, a RAP site, sits within the erosion study area and is affected by the 1%AEP flood extent.</p>
LOW TO MODERATE	<p>Scheme boundary [3] The upstream boundary of the Upper Ruamāhanga schemes sits below the gorge area. It is recommended that this is reviewed in conjunction with landowners in the upstream area, and with reference to issues 93 and 94</p> <p>Private houses in erosion study area [4, 5, 6, 8] A number of house sites sit within the erosion study area. The houses are not affected by the 1%AEP flood event.</p> <p>Stock access bridge [7] A privately owned stock access bridge sits within the erosion study area and is potentially at risk of damage linked to flood debris, bed level changes and large flood events.</p>	<p>SH2 within erosion study area [9] State Highway 2 sits within the erosion study area at this location. It is considered to be at lower risk due to its distance from the active channel of the river, and the underlying geology.</p> <p>Private bridge [11] A private access bridge crosses the river. Its abutments are within the erosion study area. It may be susceptible to debris flows, erosion and bed level changes.</p>
MODERATE		
HIGH		

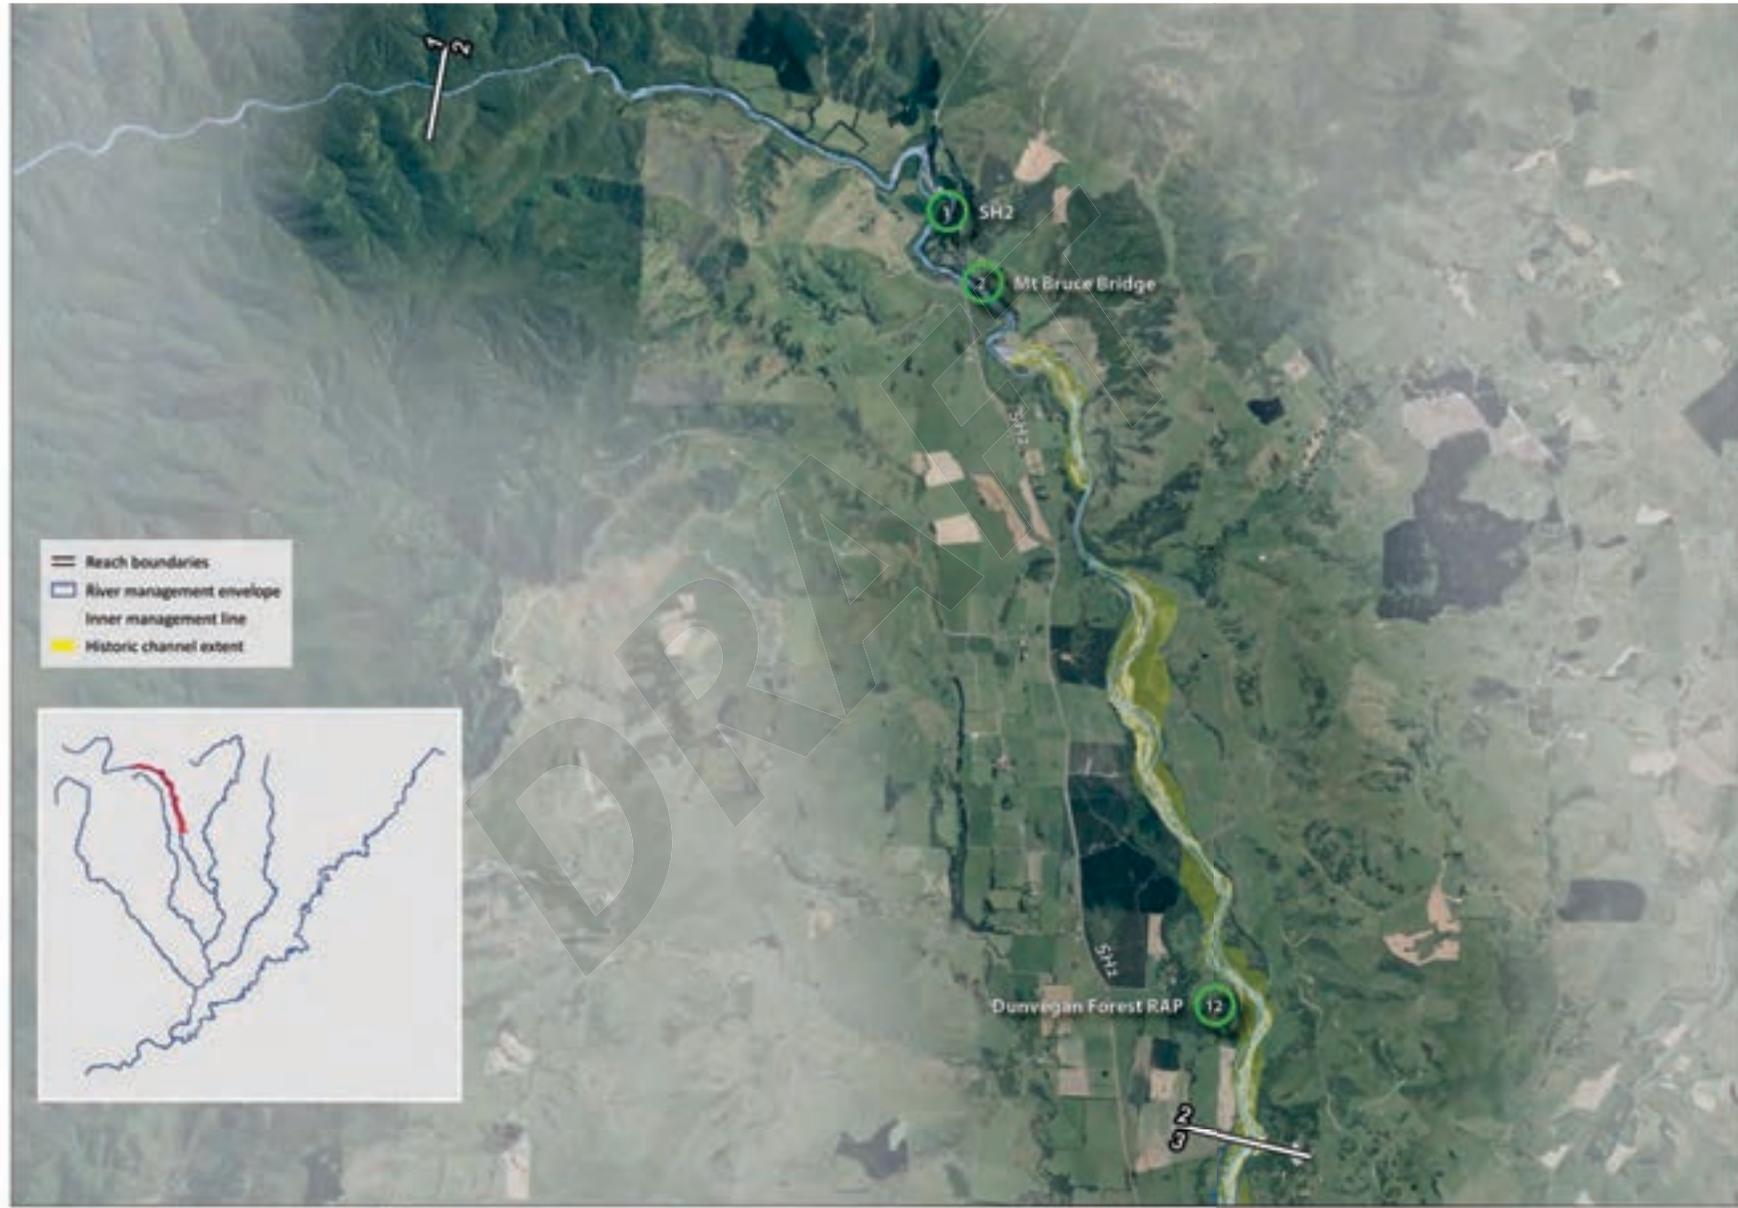

Mount Bruce – Reach 2

Response

Common methods and specific responses that apply to this reach are set out below. The common methods used to address specific issues are listed in *Appendix 5*.

Reach Specific Responses

	ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES	LEVEL OF SERVICE (AEP)		RESPONSIBILITY		PRIORITY
					CURRENT	TARGET	PRIMARY	SECONDARY	
SPECIFIC RESPONSES	12	Dunvegan Forest RAP site	River management	Dunvegan Forest is an area of remnant native forest. While there is no requirement to protect this area against natural erosion or flood effects, there is an opportunity to reduce the impacts of flooding and erosion through river management approaches sensitive to impacts on the forest. GWRC to provide advice to the managers of the RAP site on how to avoid erosion losses and damage to the site. Only soft edge protection is required. This area is ideal as a trial site for native edge protection methods.			Landowners	GWRC	Low
	1 2	SH 2 and Mt Bruce Bridge	River management	GWRC Operations to provide information to NZTA if any erosion risk is identified to State Highway 2. NZTA to continue to monitor risks to State Highway 2 and Mount Bruce Bridge. A couple of locations have been identified as being within potential erosion extents, however the risk is considered low and there are no known historic issues that have required management.			NZTA	GWRC	High
		Mt Bruce Bridge	Environmental enhancement	The Mt Bruce Bridge access area is a popular access location. Opportunities will be developed as part of the environmental strategy to formalise this access point to provide clear safe access to the river and associated facilities. Community ownership of these access points is an essential component of their success. GWRC will initiate and support the formation of a care group to work with clubs and individuals that value this location.			GWRC	Community	Low
COMMON METHODS		Entire reach	River management	River edge envelope, river bed level monitoring, recognition of buffers as a river management tool, pool-riffle-run envelope, historic channel lines, isolated works support, Code of Practice, mixed vegetation planting, alternative land uses within planted buffers					
		Entire reach	Planning and policy	Protection against deforestation in upper catchment, land use controls, flood hazard maps, rural stopbank policy, scheme decision policy, abandonment/retirement of assets, land access & strategic land purchase					
		Entire reach	Emergency management	Emergency management planning, community resilience, flood forecasting and warning system					
		Entire reach	Environmental enhancement	Environmental strategy, Community Support Officer, care group and clubs					
		Entire reach	River management	Remove this reach from the current river scheme. Begin standard Isolated Works funding policy for landowner initiated works upstream of Hidden Lakes.					

Hidden Lakes – Reach 3

Character

This reach undergoes a transition from a semi-enclosed channel in the upper valley into the broader open character of the Upper Ruamāhanga Plains. As the river continues south, the channel increases in width and begins to form a more distinctive semi-braided channel. In association with braids, bank modification also becomes increasingly more prevalent, with shelves covered by willow planting and tree lucerne common along this reach.

Key Characteristics

Emerging semi-braided form containing riffles and pools

Willow lined margins

Open pastoral character culminating along modified river margins

Values

This reach continues through rural land used for primary production and predominantly established in pasture grassland. Beach re-contouring and willow planting becomes more common along this reach together with several areas of indigenous vegetation. Overall the level of landscape modification is medium with medium-high scenic value.

Some kayaking continues along this reach benefitting from flat water with riffles and braids that continue downstream from Mount Bruce Bridge. Whilst fishing remains infrequent in this area, fish passage with the upper reaches remains important. Double Bridges provides a popular swimming site from which kayaking and fishing values also continue downstream.

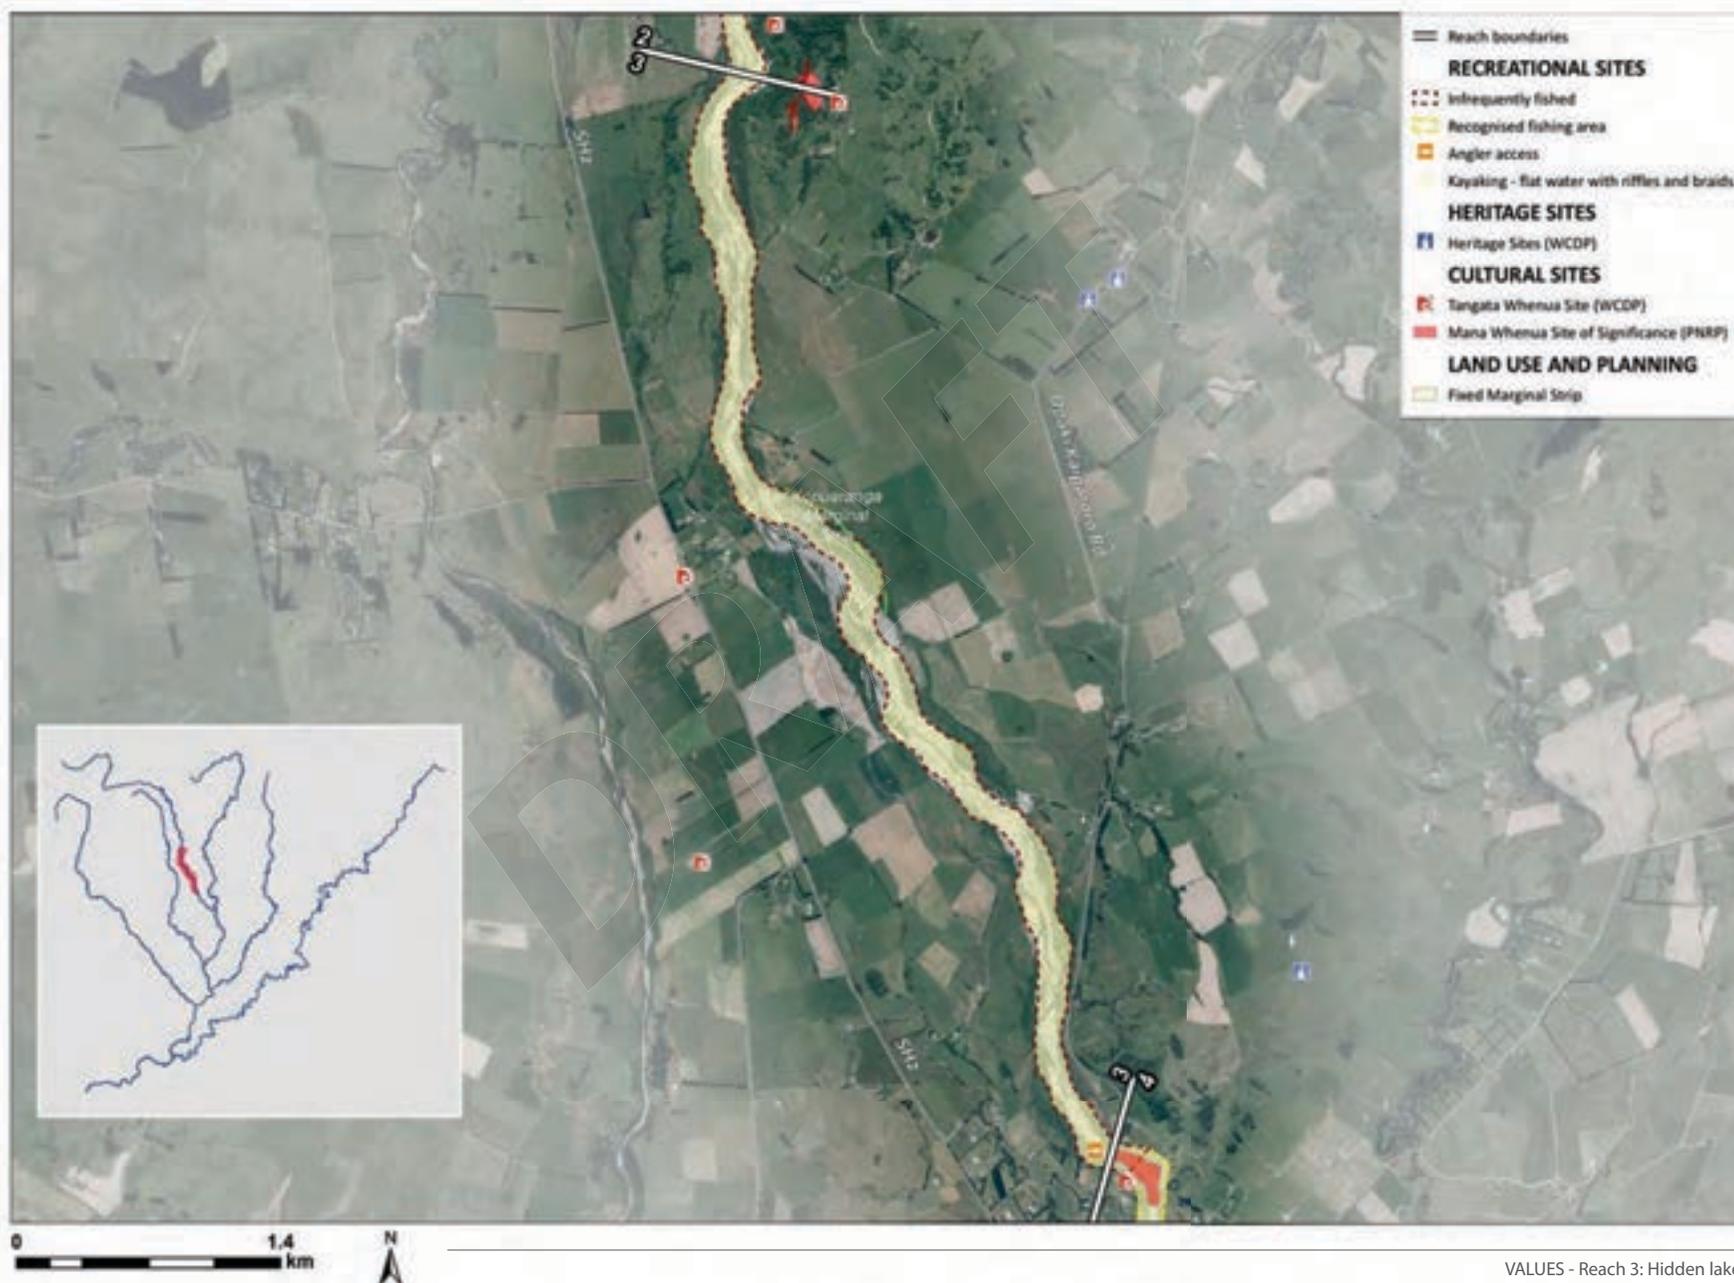

Terrestrial habitats with identified ecological value along this reach include areas of unfenced indigenous forest, mixed exotic-indigenous forest, indigenous treeland, stonefield and boulderfield, and natural wetlands and ponds.

There are also numerous sites of cultural importance along this reach, including a strong association with an historic pā site adjoining Hidden Lakes alongside other house sites, a taniwha lair and established associations with mahinga kai.

Key Floodplain Management Points

- River enhancement expenditure has previously been between 0% and 3% of total annual expenditure and this FMP increases this allowance. A Community Support Officer will also support enhancement works.
- This FMP will shift the focus of river maintenance towards more intensive implementation of vegetated buffers. The design buffers will be allowed to erode when and where appropriate. This method will substitute the immediate response to erosion issues with the machinery in channel works practiced in the past.
- Recognise the significance of cultural values associated with this reach.
- Sustainably manage the gravel quantities within this reach in order to protect the double bridges from scour or the effects of reduced flood capacity.
- Work with the asset owners of the Double Bridges to ensure their protection against flooding and erosion impacts and maintain their ongoing operation.

VALUES - Reach 3: Hidden lakes

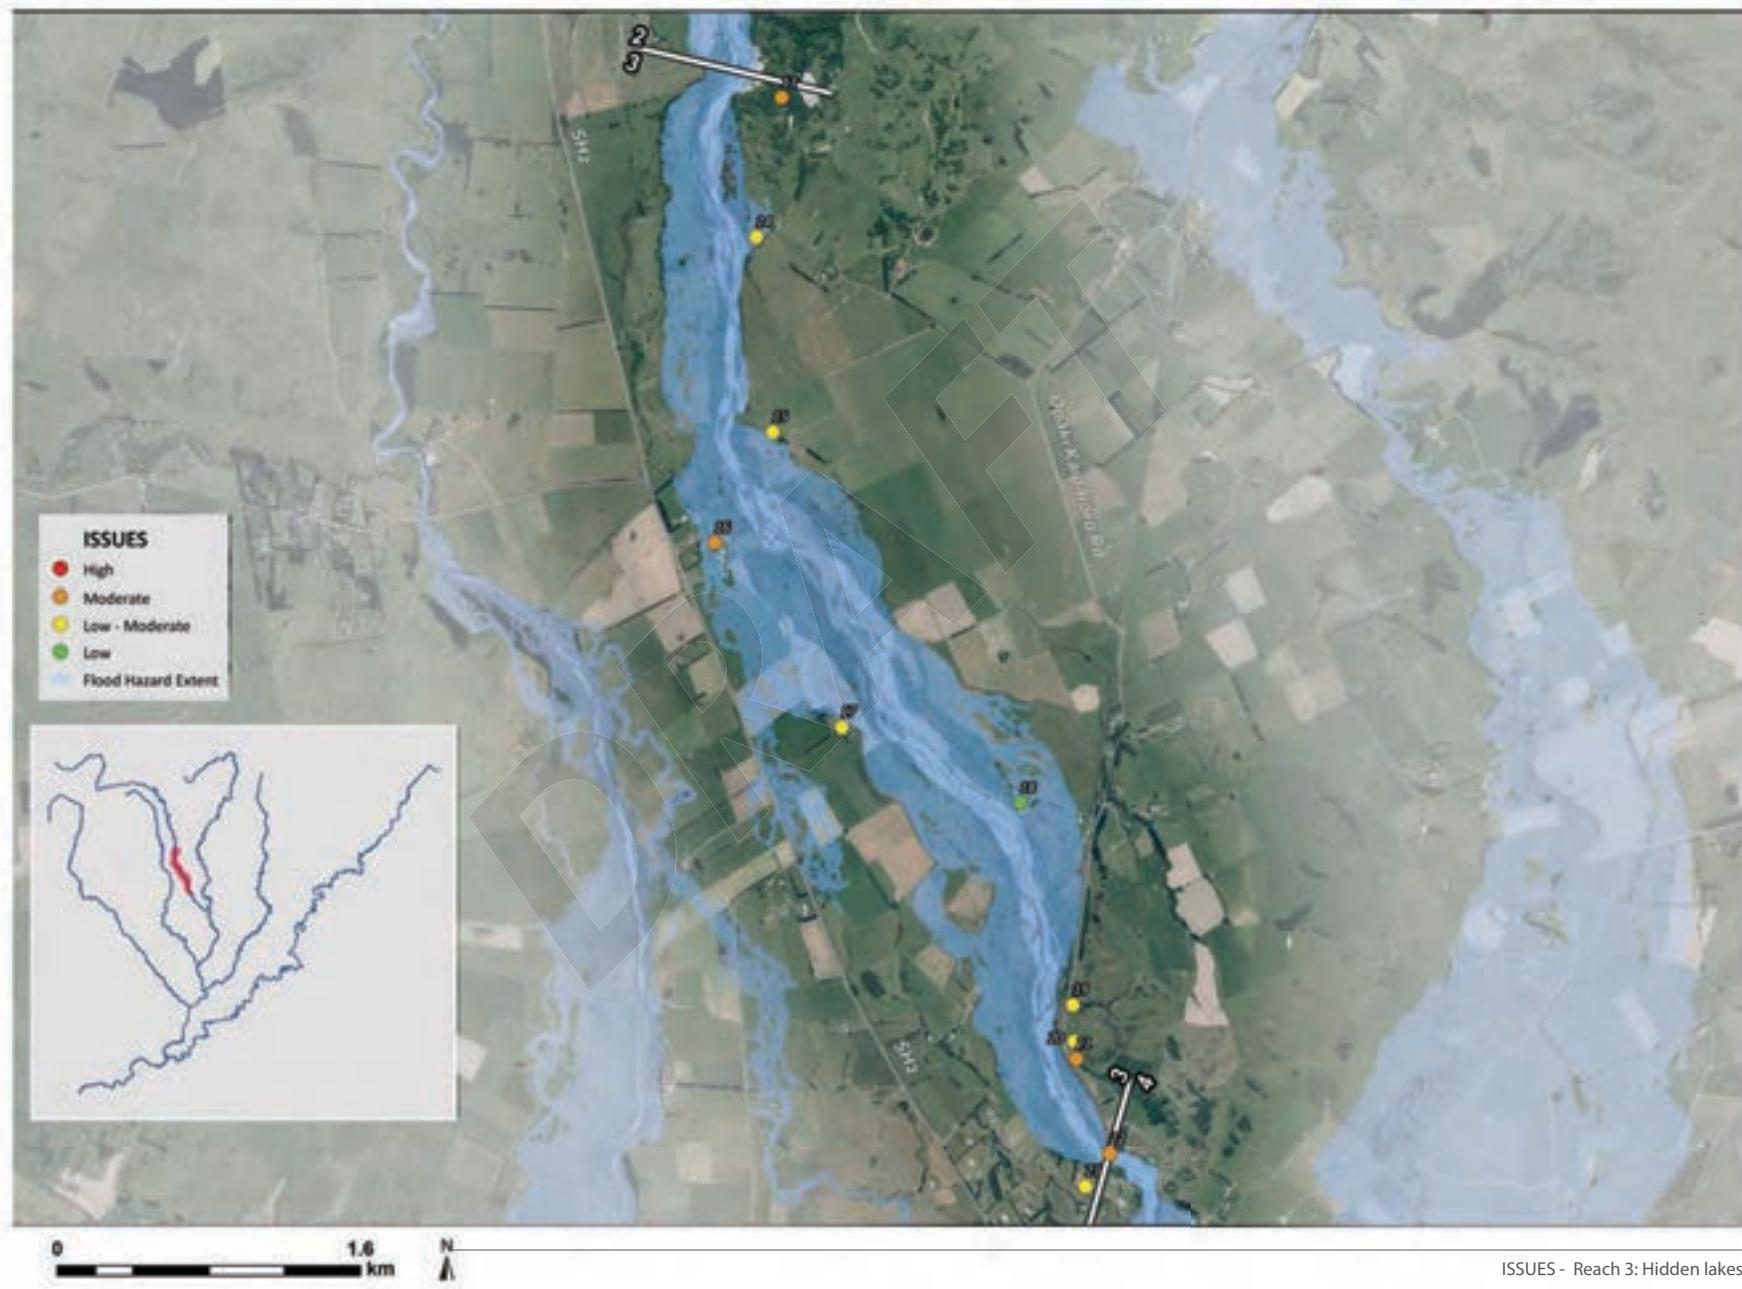

Hidden Lakes – Reach 3

Flood and erosion issues

A total of 11 flood and erosion issues have been identified along this reach. Issues have been ranked according to their consequence and likelihood (i.e. risk) and assigned an ID number [xx].

LOW	<p>Gravel extraction [18] This location is a good gravel extraction point with good current access. Significant degradation has occurred which may limit opportunities for gravel extraction in the future. Used and licenced by GWRC Flood Protection.</p>	
LOW TO MODERATE	<p>Farm ancillary buildings [14] A small group of buildings believed to be farm ancillary structures are located in the erosion study area and are modelled as affected by the 1% AEP flood event.</p> <p>House within erosion study area [15] House located within the erosion study area and outside the 1% AEP flood extent.</p> <p>Houses within flood hazard areas [16, 17] A couple of houses sit within but near the edge of the erosion study area and are affected by the 1% AEP modelled flood extents.</p>	<p>Houses in erosion study area [19] Two houses sit within the erosion study area. These are, however, protected by the railway line and SH2. The erosion risk at this location is believed to be low.</p> <p>Opaki Kaiparoro Rd in erosion study area [20] Opaki Kaiparoro Rd sits within the erosion study area. However, it is considered of low risk due to adjacent geology.</p> <p>Houses in erosion area [23] There is a small group of houses near the southern abutments of Double Bridges which sit within the erosion study area. These are set far back from the channel edge, and are considered to be of low risk due to underlying geology.</p>
MODERATE	<p>Hidden Lakes [13] The Hidden Lakes area is a site of regional significance. It sits within the erosion study area, and the bank edge adjacent to this site is subject to active erosion. There is no requirement to protect this site from natural erosive forces.</p> <p>Railway line in erosion study area [21] The main north south railway line sits within the erosion study area. The area is considered to be of lower risk due to surrounding geology and the infrequent use of the line.</p>	<p>Double Bridges [22] Both the rail bridge and Opaki Kaiparoro Rd Bridge that make up Double Bridges sit within the erosion study area. Current bed level management allows sufficient freeboard for flooding through the structures up to the bridge soffits. There are, however, concerns about scour around the bridge piers.</p>

RESPONSES - Reach 3: Hidden Lakes

Double Bridges to Te Ore Ore – Reach 4

Character

This reach continues a semi-braided character which becomes progressively more channelised through the Wairapa Plains along the western toe of Te Ore Ore. The confluence with the Kopuaranga River occurs midway along this reach, below which the river widens and continues a semi-braided form across gravel with pools and riffles. Belts of willow enclose most of the river corridor and include cabled willows in some areas. Much of the surrounding landscape remains in productive rural use including several pivot irrigators, with playing fields and mixed indigenous and exotic vegetation also adjoining the river near Rathkeale College.

Key Characteristics

Broad semi-braided form

Continuous belts of willow planting enclosing margins

Cabled willow trees established in some areas

Rounded paddocks associated with pivot irrigators

Proximity to playing fields at Rathkeale College

Key Floodplain Management Points

- River enhancement expenditure has previously been between 0% and 3% of total annual expenditure and this FMP increases this allowance. A Community Support Officer will also support enhancement works.
- This FMP will shift the focus of river maintenance towards more intensive implementation of vegetated buffers. The design buffers will be allowed to erode when and where appropriate. This method will substitute the immediate response to erosion issues with the machinery in channel works practiced in the past.
- Protect the swimming hole at Rangitumau Bluff and enhance recreational opportunities.
- Reduce risk of failure to the stopbanking network which protects Rathkeale College and grounds.

Values

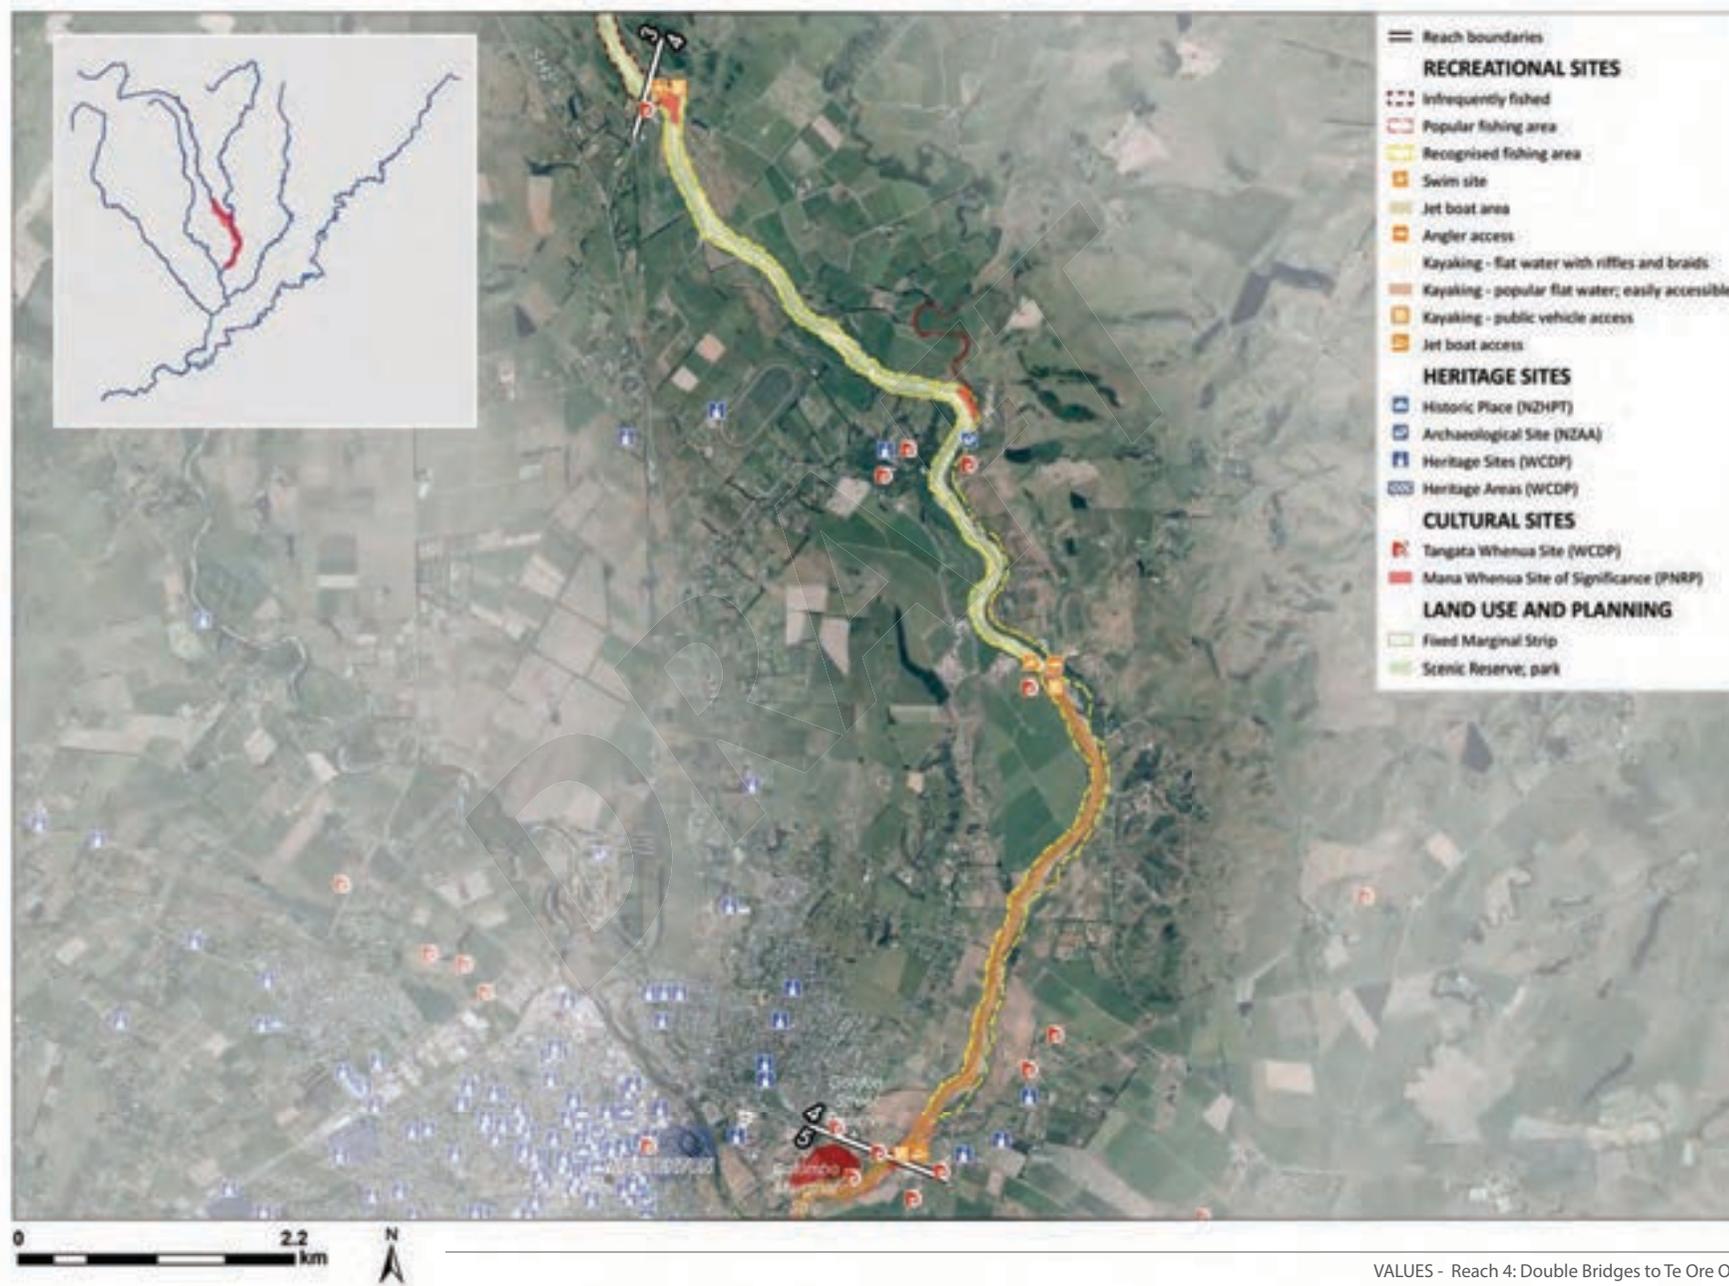

This reach flows through rural land to the north of Masterton predominantly established in pasture grassland and increasing rural lifestyle settlement. Through this area, the margins of the river become increasingly modified with stop banks and willow and pole planting, particularly adjacent to Rathkeale College. Overall the level of landscape modification is medium with a corresponding medium level of scenic value.

The area is commonly used for fishing and kayaking as it contains flat water which is easily accessible for beginners. Such recreation activities are typically accessed from bridge crossings at Double Bridges and Te Ore Ore Road, with an additional access point identified along Black Rock Road. Swimming is also popular at these access points, as well as a swimming hole identified at Rangitumau Bluff .

Terrestrial habitats with identified ecological values along this reach include fenced indigenous forest, mixed exotic-indigenous forest, indigenous treeland, stonefield, boulderfield, natural wetlands and ponds. The area also accommodates a breeding population of nationally endangered black-billed gulls along the stonefield and boulderfield areas and represents one of the few locations where populations of this species have grown in number in recent years in New Zealand.

Along the western banks of the river, the main house of Rathkeale College is an important heritage site identified in the WCDP. There are also several cultural sites in this area including marae, historic pā sites, urupa, waahi tapu and mahinga kai associations.

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES
LANDSCAPE MODIFICATION	SCENIC VALUE

Double Bridges to Te Ore Ore – Reach 4

Flood and erosion issues

A total of 26 flood and erosion issues have been identified along this reach given its close proximity to Masterton. Issues have been ranked according to their consequence and likelihood (i.e. risk) and assigned an ID number [xx].

LOW	<p>Stopbank within erosion study area [27] A stopbank sits within the erosion study area and inside the existing management buffer extents.</p> <p>Water intake [41] A private subsurface intake that would be adversely affected by any changes in bed level.</p> <p>Water intake [42] A water intake sits within the erosion study area for use as part of a frost protection system.</p> <p>Channel alignment [43] The channel alignment is being artificially maintained by hard edge protection. The river naturally tends to a wider channel through this reach.</p>	<p>House [44] A private house sits within the erosion study area. However, it is considered of low risk due to underlying geology and distance away from river. No currently managed issues exist.</p> <p>Te Ore Ore Bridge power lines [48] Transmission lines cross the river north of the Te Ore Ore Bridge. The pylons are located within the erosion study area but are set back from the river bed and outside the active channel. No currently managed issues exist.</p> <p>Te Ore Ore Bridge [49] Te Ore Ore Bridge is relatively new and therefore less susceptible to scour issues. Weirs are located downstream which have historically been used to control bed levels for earlier bridges. These have been modified, and further changes to them could have impacts on this bridge. The bridge abutments sit within the erosion study area.</p>
LOW TO MODERATE	<p>Opaki water race intake [24] The Opaki Water race intake sits within the erosion study area and is affected by bed level changes within the active channel. The intake bed levels are relatively stable due to the proximity to the Double Bridges. Occasional maintenance undertaken by MDC is required to ensure continued operation.</p> <p>Rangitumau Road [26] The road sits within the erosion study area, however it is well protected by a rock bluff and therefore considered to be of low risk. No currently managed issues exist.</p> <p>Swimming hole [25] There is a popular but occasionally hazardous swimming hole at the base of the bluff near Rangitumau Road.</p> <p>House [31] A single dwelling sits within the erosion study area, but outside and above the 1% AEP flood event extents. No currently managed issues exist.</p> <p>Rathkeale College outbuildings [32] A number of small facilities for Rathkeale College are contained within the erosion study area and the 1% AEP flood extents.</p> <p>River bed armouring [34] The bed in locations downstream of Rathkeale College has a tendency to become 'armoured' and needs ongoing maintenance. This is believed to be caused by erosion of finer sediments from the adjacent cliffs.</p>	<p>House [36, 35] Houses are located within the erosion study area and the 1% AEP flood extents. No currently managed issues exist.</p> <p>Private water intake [37] A private water take is situated with the erosion study area, however there are no known issues with its ongoing operation. No currently managed issues exist.</p> <p>Outbuildings [38] A farm storage building, or possibly utility structure, is located within the erosion study area, but outside the 1% AEP flood extent. No currently managed issues exist.</p> <p>Houses [40] Two houses on Black Rock Road sit within the erosion study area. While these properties sit outside the modelled 1% AEP flood extent, they would be affected by any overflow occurring through the water race.</p> <p>Industrial yards [47] Sheds, machinery and possibility of contaminants sitting within the erosion study area and the 1% AEP flood extent. No currently managed issues exist.</p> <p>Te Ore Ore stopbank [46] This is a low standard stopbank that protects several properties. The modelled 1% AEP event overtops this stopbank and affects a number of properties behind it and Te Ore Ore/Castlepoint Road.</p>
MODERATE	<p>Erosion control works [28] Ongoing erosion controls are required to protect the Rathkeale Stopbank which is currently at risk of being undermined.</p> <p>Henley Lakes water intake [45] The water intake for Henley Lake occasionally has issues associated with channel alignment and changes in bed level.</p>	<p>Urupa Site [30] A historic urupa site sits on the edge of a cliff above the Ruamāhanga River and within the erosion study area.</p> <p>Rathkeale College Sewage Pond [33] Currently unused sewage settlement ponds for Rathkeale College sit within both the erosion study area and the 1% AEP flood extents.</p> <p>Black Rock Road [39] Black Rock Road is located within the erosion study area. It has required erosion protection within the last 10 years.</p>
HIGH	<p>Rathkeale stopbank [29] The Rathkeale Stopbank sits well within the buffer and erosion study area and is currently protected to a low erosion security standard by ongoing erosion management works.</p>	

Double Bridges to Te Ore Ore – Reach 4

Response

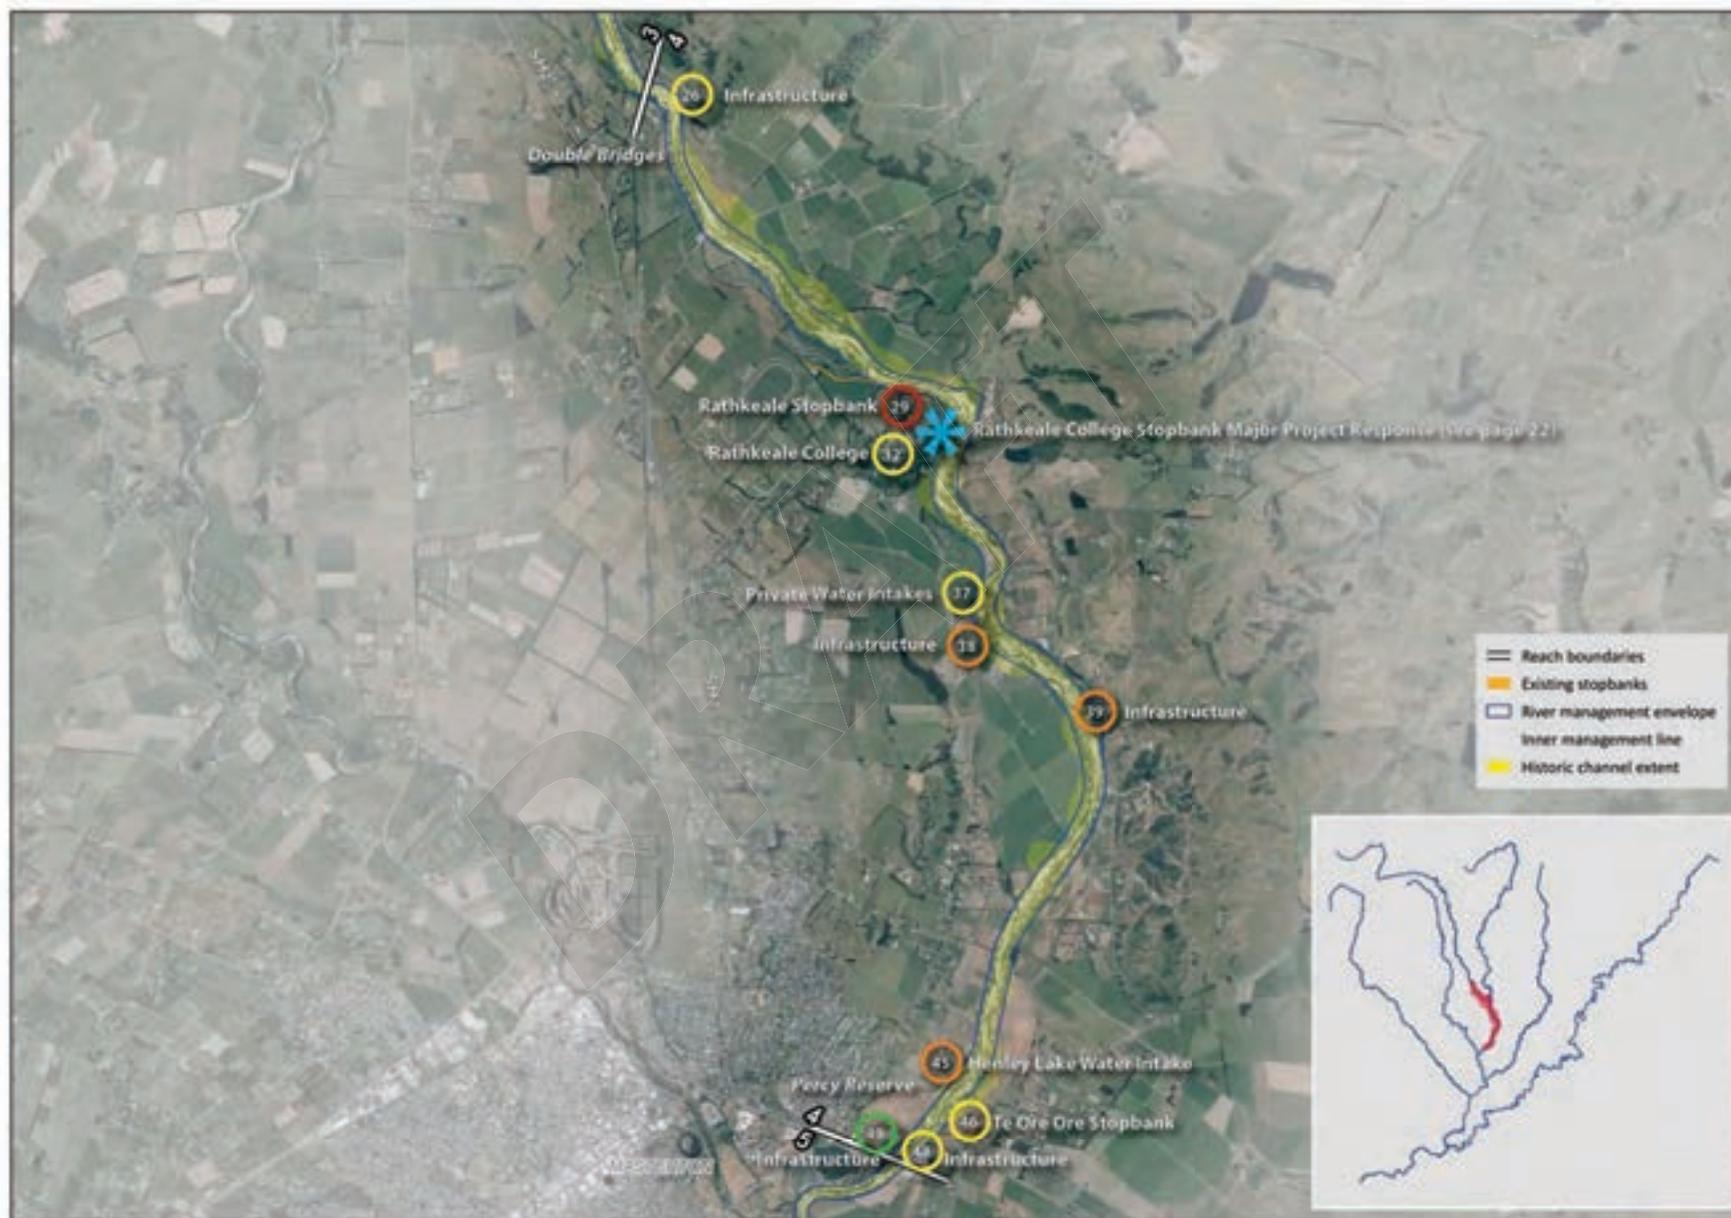

Common methods and specific responses that apply to this reach are set out below. The common methods used to address specific issues are listed in *Appendix 5*.

Reach Specific Responses

ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES	LEVEL OF SERVICE (AEP)		RESPONSIBILITY		PRIORITY	
				CURRENT	TARGET	PRIMARY	SECONDARY		
SPECIFIC RESPONSES	29	Rathkeale stopbank	Emergency management	The stopbank at Rathkeale College breach scenarios will be defined to identify likely overflow routes and consequences of failure affecting the college and accesses to the college. While it is unlikely that a breach or failure of a relocated and upgraded stopbank will occur it is possible that any overdesign event will affect access into the college area during such an event leaving the college, its pupils and staff more vulnerable.	5%	1%	GWRC	Rathkeale College, Landowners	High
	32	Rathkeale College	Emergency management	WREMO to develop an emergency management plan with Rathkeale College for large flood events. In a 1% AEP event without further improvement to the protection infrastructure the college will be cut off from access to external services for a short period of time due to an overland flow path that runs south of the college. Due to local topography it is likely that heavy rainfall events in the vicinity of the college could have a similar effect of cutting road access.		1%	Community	WREMO	High
	45	Henley Lake water intake	River management – Bed level monitoring	GWRC to work with Masterton District Council to maintain security of intake for Henley Lakes. The river management activities will be planned to not compromise intake functionality.			GWRC	MDC	Medium
	46	Te Ore Ore stopbank	River management	Define the level of service requirement to current standard and maintain to this defined standard.			GWRC	Landowners	Medium
	26, 38, 39, 48, 49	Infrastructure	Emergency management	Inform asset owners of risks to infrastructure assets in this reach and encourage them to prepare contingency plans to address flood and erosion risks. GWRC and WREMO to provide advice and support if requested.		1%	Asset owners	WREMO	Medium
	37	Private water intake		River management envelopes will contribute to security of private water takes. Private water takes will have low risk of damage up to a 20% AEP event. Damage to structures is more likely up to a 5% AEP event.		20%	Landowners	GWRC	Low
		Percy Reserve	Planning and policy	Policy development to address freedom camping in the reserve			MDC	Community	Medium

RESPONSES - Reach 4: Double Bridges to Te Ore Ore

Major Project Response Summary: Rathkeale College Stopbank

The issue

Rathkeale College is a boys' secondary school located approximately 5km north of Masterton, on an inside bend of the Ruamāhanga River. This reach of the Ruamāhanga River is extremely narrow, which has caused significant erosion of the banks on both sides of the river.

There is infrastructure within the erosion hazard zone and associated vegetative buffer zone on both banks. A pivot irrigator has been installed on the farmland on the north bank, and a stopbank is present along the boundary of the Rathkeale school grounds.

The stopbank is of poor quality, with mature trees growing too close to the bank on the river side. The buffer between the stopbank and the river is very narrow and has been under consistent erosion pressure. Stopgap erosion protection measures including debris fences and rock groynes have been used to protect the stopbank.

The erosion pressure through this reach is anticipated to remain, and therefore a long-term solution that removes the existing infrastructure from the buffer is necessary.

The current vegetative buffer through this reach is significantly narrower than that present upstream or downstream of the reach. This is not considered ideal as it requires significant expense and work to maintain or reinstate the banks after erosion occurs. Planting the full width of the existing buffer, and potentially widening the buffer through this reach, would be beneficial.

Relationship with common methods

The options for this reach (outlined below) are consistent with the use of the common methods 'river edge envelopes' and 'recognition of buffers as a river management tool'.

Description

General

GWRC staff and Te Kāuru Upper Ruamāhanga FMP Subcommittee members have undertaken discussions with the adjacent landowners to develop an option for this reach.

Options for this reach include:

- Fully planting the existing (narrow) vegetative buffer
- Fully planting a widened vegetative buffer
- Retreating the Rathkeale stopbank further back from the river edge
- Increasing the width of the river channel
- Realigning the river channel

Implications

All of the options outlined involve the loss of some productive land for the adjacent landowners. River widening, or realignment will have impacts on the river ecology through the reach during construction.

Priority

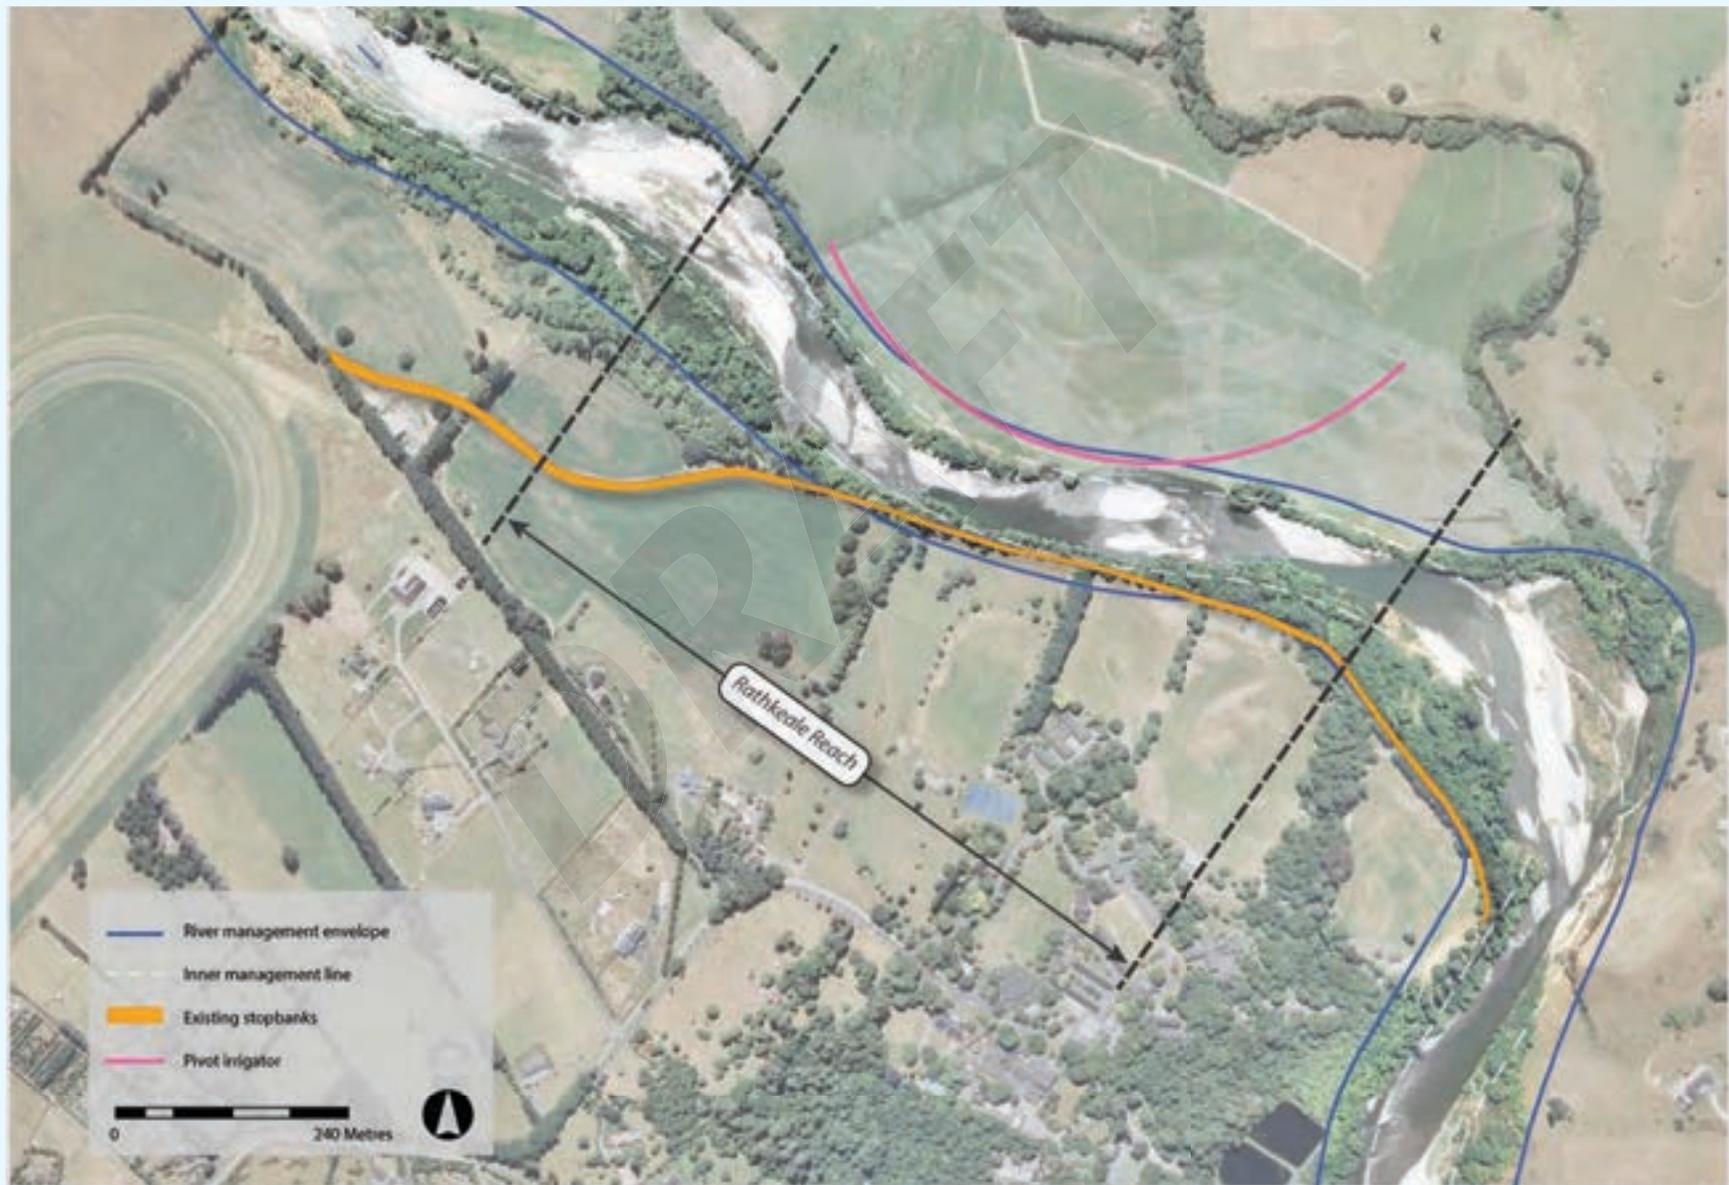

Medium. There has been recent bank erosion on both sides of the river through this reach, including damage to the Rathkeale stopbank (see photo) although this has since been reinstated.

Level of Service

A 1% AEP (with climate change) level of service, to be confirmed with Rathkeale College and local residents.

REFERENCE NUMBER	MANAGEMENT MEASURE	CURRENT LEVEL OF SERVICE	THREATS TO CURRENT LEVEL OF SERVICE	PROPOSED LEVEL OF SERVICE	PRIMARY REASON FOR RESPONSE	RESPONSIBILITY	PRIORITY	COST	FUNDING
28 and 29	TBC	Low	Erosion by the river, overtopping of stopbank	1% AEP, including climate change	To increase flooding protection to Rathkeale College and reduce erosion risk to stopbank and Rathkeale College	GWRC / Rathkeale?	Medium	\$TBC	Capital funding TBC

Te Ore Ore to Waingawa – Reach 5

Character

This reach extends from Te Ore Ore Bridge to the south of Masterton through the Masterton Plains. Urbanising influences characterise parts of the western banks of this reach including increased public access adjoining Henley Lakes, the presence of Masterton Cleanfill, and the earthworks and ponds associated with the Masterton Sewage Works. Below the confluence with the Waipoua River, the river channel tends to be managed as a single thread enclosed by willow and poplar belts along its margins, with limited public access.

Key Characteristics

Channelised bed through a gravel corridor

Increasing urbanising influences along its western margins

Poplar and willow bank planting

Values

Modified banks including stop banks are common along this reach, with willow and poplar tree belts also frequently established throughout this area. This has resulted in a high level of landscape modification overall with corresponding low-medium scenic values.

The close proximity of Masterton has resulted in a variety of recreation values including a well used recreation area established at Henley Lake Park. This includes recognised fishing areas for rainbow trout and perch. The popularity of fishing increases to the north of this reach in closer proximity to the edge of Masterton. Kayaking also occurs throughout this area in association with flatter water which is easily accessible for beginners.

There are swimming sites throughout this reach particularly at the northern end of the reach in close proximity to Masterton. A preference for swim sites upstream of the Masterton Waste Water Treatment Plant was also identified in relation to cultural and recreational values.

Terrestrial habitats of ecological value identified along this reach include areas of unfenced indigenous forest, mixed exotic-indigenous forest, indigenous treeland, stonefield, boulderfield, natural wetlands and ponds .

There are numerous cultural sites identified throughout this reach including marae, historic pā and house sites, urupa, baptism sites, mixing of mauri, a taniwha lair and associations with mahinga kai.

Key Floodplain Management Points

- River maintenance activities will involve more works to maintain stopbank conditions, and river enhancement opportunities will be explored and supported. There is an opportunity for the community to decide to raise the level of service in the reach and install more erosion protection structures in currently unprotected areas. This option has higher associated costs of annual maintenance.
- Greater effort will be used to implement buffers where possible, but this FMP acknowledges that maintaining existing rock protection works and continuing to use new rock will be required to protect important community infrastructure and assets.
- Recognise the importance of the confluence of the Waipoua and Ruamāhanga Rivers.
- Work with Masterton District Council to protect Masterton Waste Water Treatment Plant assets from flooding and erosion impacts.
- Work with Masterton District Council to protect Henley Lake Park and recreation area from negative effects of flooding and erosion.
- Work with Masterton District council to protect and ensure continued operation of Wardells Road Bridge.
- Work with Masterton District Council to protect the Masterton landfill and protect the environment from any damage that may be a risk as a result of flooding and erosion.

Te Ore Ore to Waingawa – Reach 5

Flood and erosion issues

A total of 16 flood and erosion issues have been identified along this reach. Issues have been ranked according to their consequence and likelihood (i.e. risk) and assigned an ID number [xx].

LOW	<p>Houses [66] Three houses sit within the erosion study area; however this area has no history of erosion and the high bank with cemented deposits acts to reduce risk to this location. No currently managed issues exist.</p>	
LOW TO MODERATE	<p>Transmission lines [52] Transmission lines cross the river from Henley Lake Park, where pylons on both banks sit within the erosion study area. However, these are set back from the bank edges and therefore considered to be at lower risk. No currently managed issues exist.</p> <p>Narrow channel at confluence [53] The river becomes very narrow immediately upstream of the confluence with the Waipoua. Flooding frequently occurs across the true left bank affecting a number of paddocks. This has a beneficial effect in reducing erosion pressures at River Road.</p> <p>Stopbank [59] The section of the stopbank downstream of the landfill has an unknown level of service. This stopbank is part of the protection for the Wastewater Treatment Plant.</p>	<p>House [62] A single dwelling on Lees Pakaraka Road sits within the erosion study area but is outside the modelled 1%AEP flood extent. It is currently protected by rock erosion protection.</p> <p>Channel alignment [65] The channel alignment continues to push outside of its design alignment. Ongoing rock groyne protection has been required to maintain the designed alignment.</p> <p>Channel alignment [58] Historically the channel has been wider at this location. The design channel alignment through this reach is very narrow. This possibly has upstream and downstream effects.</p>
MODERATE	<p>Riverside Cemetery [55] The cemetery sits within the erosion study area. It has historically suffered erosion and light rock protection is in place to manage some of these effects.</p> <p>Closed landfill site [56] This closed landfill site has suffered from ongoing erosion. It is currently protected by a combination of rock groyne and willow buffers. Possible erosion of contaminated material is a concern.</p> <p>Stopbank [57] A varying standard stopbank with a level of protection between 5% AEP and 10% AEP. This stopbank is very poor quality and is infested with trees. A number of downstream properties benefit from the protection it provides, including the Masterton Waste Water Treatment Plant.</p>	<p>Waste Water Treatment Plant (WWTP) [61] The Masterton WWTP site is within the erosion study area and the modelled flood extent for the 1% AEP flood event. While the WWTP has some stopbanks with a 1% AEP level of protection, these are not continuous upstream, and flooding is modelled to outflank these structures.</p> <p>Lees Pakaraka Road [63] Lees Pakaraka Road sits within the erosion study area and on the edge of the 1% AEP flood extent. It is currently protected by rock erosion protection.</p> <p>Wardells Bridge [67] The bridge abutments sit within the erosion study area. The bed in vicinity of the bridge has been observed over long period to be a stable site with low risk of erosion and scour. No currently managed issues exist.</p>
HIGH	<p>Te Ore Ore Bridge weirs [50] The Te Ore Ore weirs were installed to protect the bridges crossing the river upstream, they have suffered damage in past floods, and for a time were deemed hazardous to river users. Work has been carried out on the weirs to make them less hazardous and less visually obtrusive, however sections of the weirs remain in place, acting like groyne.</p> <p>Henley Lakes [51] The banks adjacent to Henley Lakes Park are continually under erosion pressure. There is current work in progress to establish vegetative buffers and retreat the existing bank edge to reduce the erosive impacts. A significant area of the park is within the design channel. The narrow river width creates additional erosion pressure.</p>	<p>River Road properties [54] 14 River Road properties sit within the erosion study area. A dangerous erosion hazard was observed here in the 1998 floods and some parts of these properties eroded into the river. This erosion is currently managed by a series of heavy rock groyne, this requires ongoing maintenance and management.</p> <p>WWTP irrigation beds [60] The irrigation beds for the Masterton Waste Water Treatment Plant are within the erosion study areas and the erosion management buffer areas for the river. They are vulnerable to greater than a 50% AEP flood event.</p> <p>WWTP discharge point [64] The Wastewater Treatment Plant discharge point sits within the erosion study area.</p>

Te Ore Ore to Waingawa – Reach 5

Response

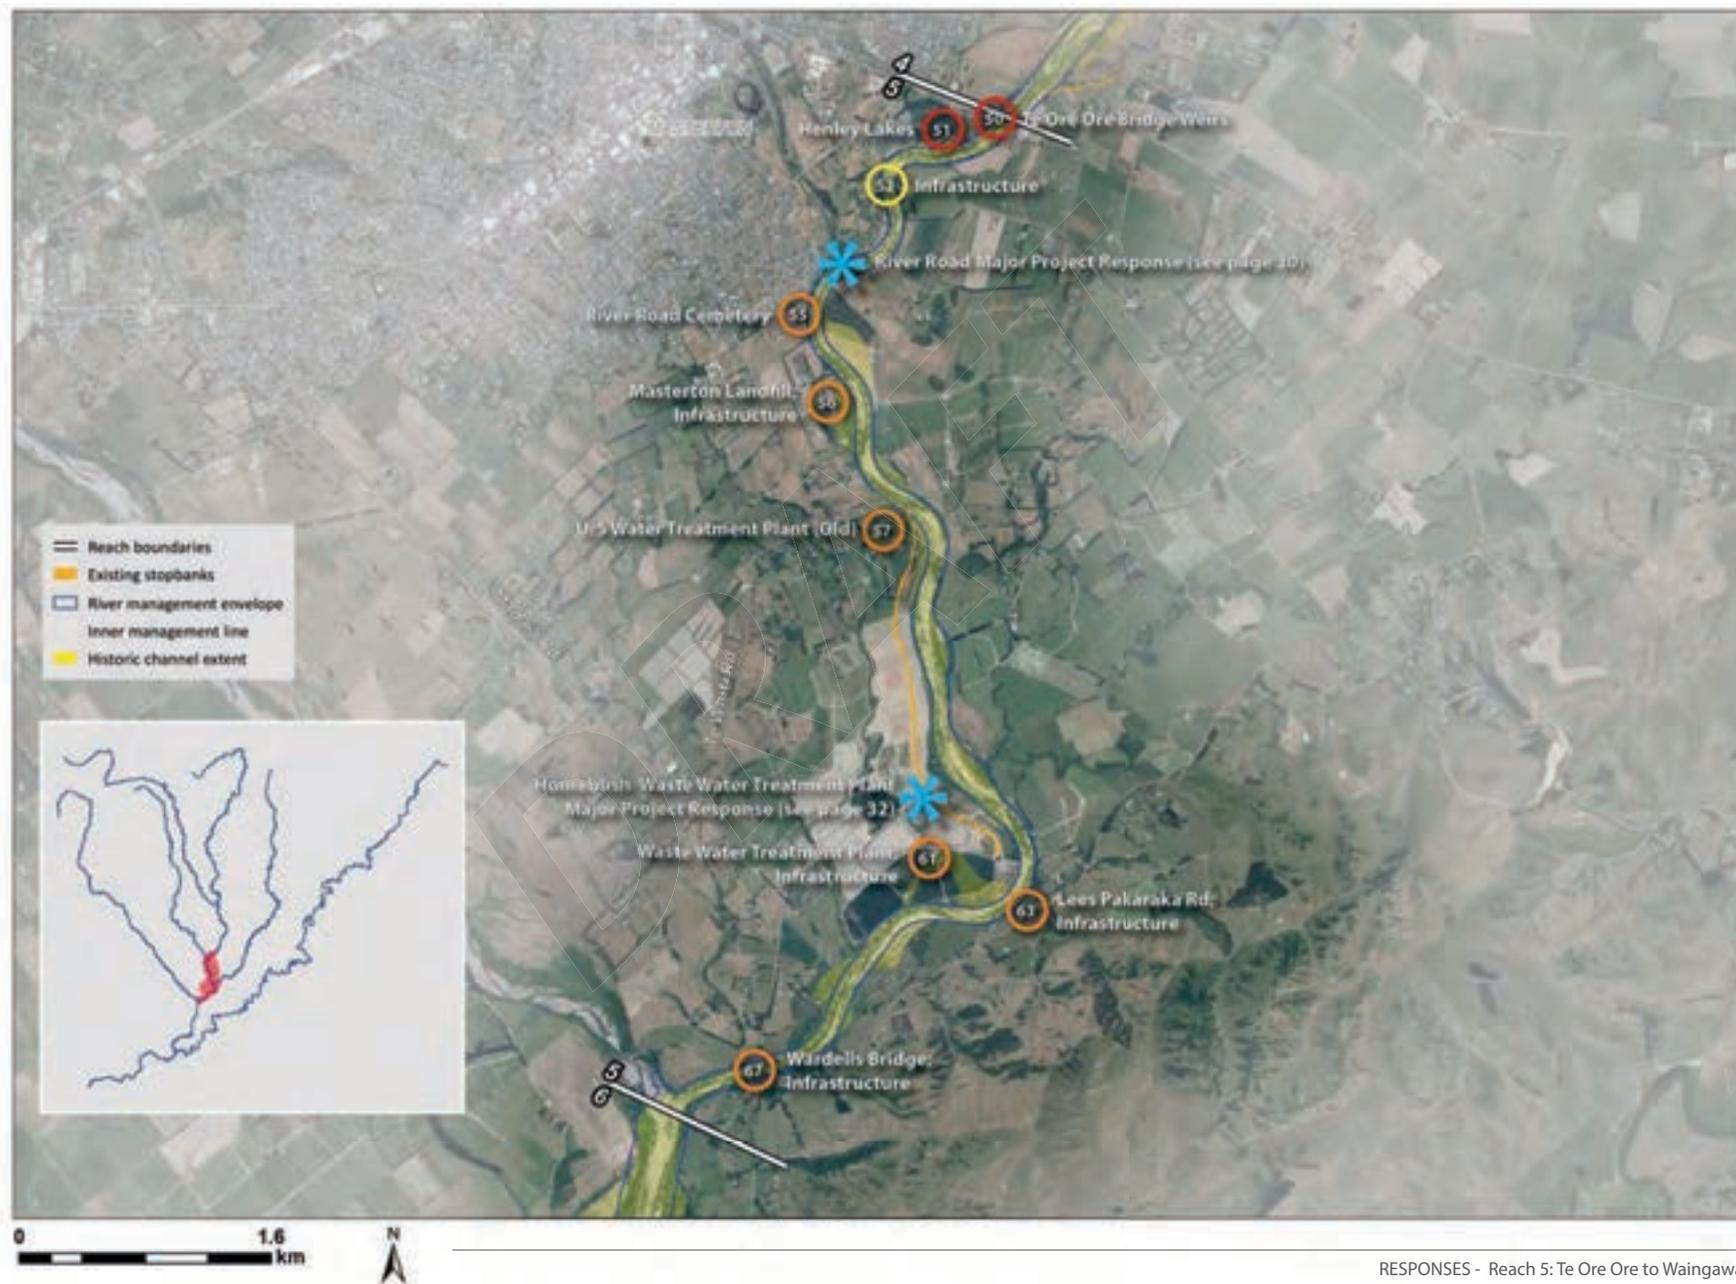

Common methods and specific responses that apply to this reach are set out below. The common methods used to address specific issues are listed in *Appendix 5*.

Reach Specific Responses

	ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES	LEVEL OF SERVICE (AEP)		RESPONSIBILITY		PRIORITY
					CURRENT	TARGET	PRIMARY	SECONDARY	
SPECIFIC RESPONSES	51	Henley Lakes	River management	Narrow design lines to be reconsidered during design lines update process. Until then the narrow channel will be maintained as usual.	20%	5%	GWRC	MDC	Medium
	50	Te Ore Ore Bridge weirs	River management	Remove remains of rail iron and concrete block weirs.			GWRC	MDC	Medium
	55 56	River Road Cemetery and Masterton Landfill	River management	Prior to implementation of the River Road major project response (page 30), continue to maintain the rock groynes established to provide erosion protection.			GWRC	MDC	High

RESPONSES - Reach 5: Te Ore Ore to Waingawa

Major Project Response: River Road

The issue

A number of residential properties on River Road are located within an erosion hazard area, four of which are in close proximity to the current river bank. Active erosion has been observed in recent years, and during the 1998 flood event some parts of these properties being eroded into the river. While rock groynes have been constructed at the toe of the bank over a long period of time, they were not specifically designed to withstand large flood events and are not considered to provide a high level of security. Immediately downstream of the residential properties on River Road is the Masterton cemetery and the landfill, which are protected by a large number (19) of rock groynes as well as a reasonably well-established willow buffer.

Opportunities

The opportunity to widen and deepen the existing overland overflow path on the left berm of the Ruamāhanga floodplain was investigated to take a greater amount of flow and become operational in smaller (50% AEP) flood events. This area is a natural overflow path based on the existing topography observations from past floods. Historically the location of the main channel flowed through the area as seen on the cadastral plans. This option provided little reduction in velocities and erosion potential. An alternative to this is to widen and realign the current main river channel through this reach by approximately 30m to make room for construction of rock groynes and a planted buffer on the right bank immediately downstream of the Waipoua confluence. As well as making room for these new groynes and buffer to protect the residential properties on River Road, the widening of this reach would reduce the pressure on the existing rock groynes that are protecting the cemetery and landfill.

Relationship with common methods

Making room for the river is consistent with the river management responses described in the common methods, along with improved planted buffers and rock groynes. The main channel is currently up to 10m inside the inner management line on the left bank.

Description

General

The current erosion risks at River Road, as well as the cemetery and landfill area immediately downstream, will be reduced by widening/realigning the main channel away from the current right bank by approximately 30m, combined with rock groynes and planted buffers. To provide a channel widening solution that fits with the existing structures in this reach requires a total length of widening of approximately 600m. Easements may be required to allow construction of the groynes on the River Road properties.

The 30m widening of this reach over a distance of 600m requires excavation of approximately 40,000m³ of material. It is expected that approximately half of this would be used for realignment at the upper end of the reach with the remaining being removed from the site through gravel extraction permits.

With the channel widening complete, a series of rock groynes can be constructed for approximately 150m from the confluence of the Waipoua/Ruamāhanga Rivers. Approximately six groynes would be constructed over a length of around 150m. Willow buffers would be planted in between the rock groynes to improve the overall level of protection.

Costs

Channel widening/gravel extraction work on the left bank of the Ruamāhanga River directly downstream of the Waipoua confluence for 600 m. Up to \$60,000 for bed/beach recontouring of 20,000 m³ in addition to 20,000 m³ of gravel extraction assumed to be through the permit system and extracted at no cost.

Rock Groynes - up to \$575,000 based on each groyne being approximately 250 tonnes, P&G and Contingency of 30% (savings could be achieved through reuse of existing rock, if appropriate). This will include channel widening/gravel extraction work on the left bank of the Ruamāhanga River, bed/beach recontouring, and strip vegetation.

Implications

The new rock groynes would be larger in scale than the existing groynes and would need to be sufficiently keyed into the river bank to maximise their structural integrity. This would require accessing and utilising private land associated with the adjacent River Road properties. To ensure protection and future maintenance access to these structures, easements through the affected properties will be required. Other legal considerations may also be required for the crown owned land that would be affected by the enlargement on the left bank. This may involve confirmation of accretion claim status and formalising a river works easement, and discontinued use of this land by the eastern river bank landowners for primary production. Initial consultation with affected property owners has been undertaken in late 2017.

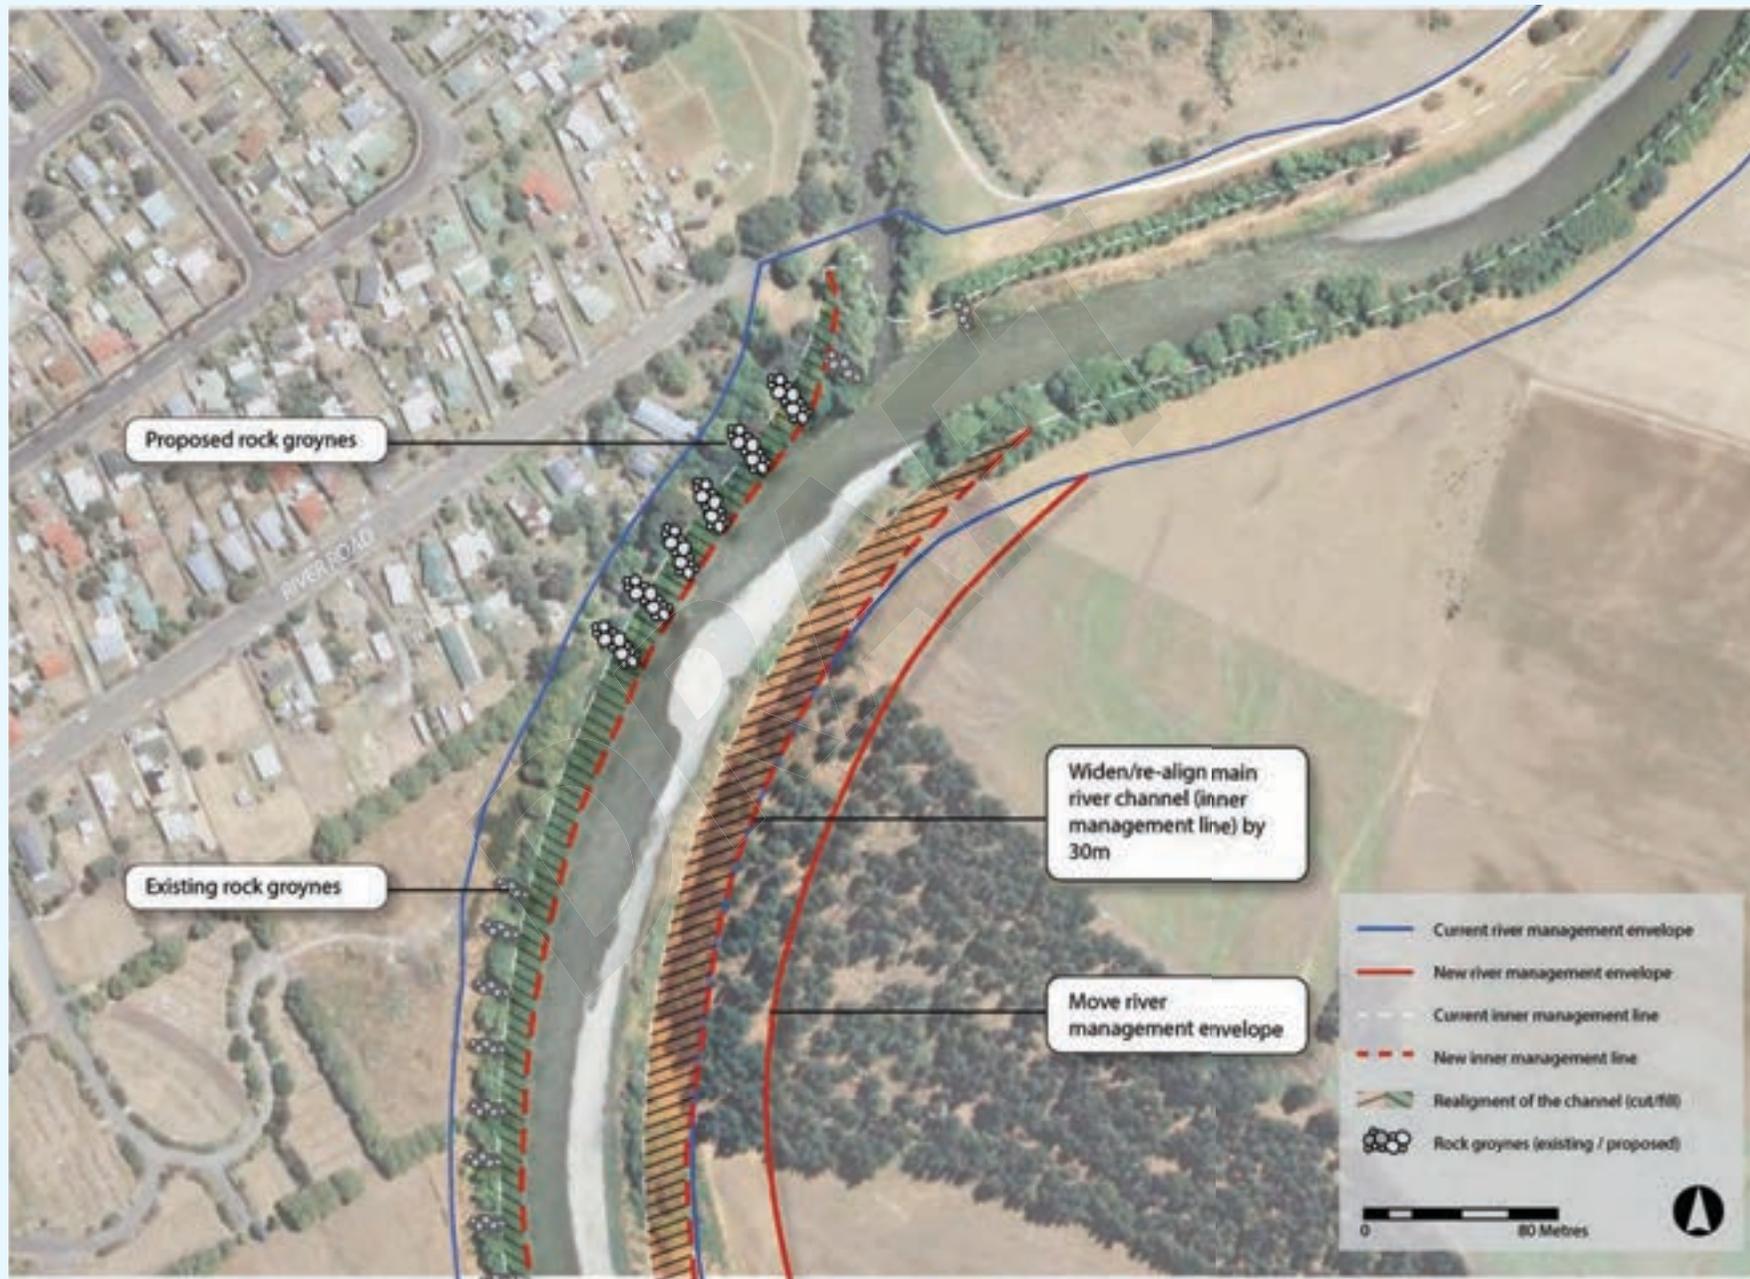

Priority

This response is classified as high importance and high priority.

Level of Service

A 1% AEP level of service is proposed.

REFERENCE NUMBER	MANAGEMENT MEASURE	CURRENT LEVEL OF SERVICE	THREATS TO CURRENT LEVEL OF SERVICE	PROPOSED LEVEL OF SERVICE	PRIMARY REASON FOR RESPONSE	RESPONSIBILITY	PRIORITY	COST	FUNDING
132	Increase bank protection to river edge at River Road and widen river channel.	<5% AEP	Erosion by the river	1% AEP	To increase protection to River Road, Masterton	GWRC	High	\$575,000	Capital funding TBC

Major Project Response: Homebush Waste Water Treatment Plant

The issue

The most recent hydraulic modelling of the Upper Ruamāhanga and Waipoua Rivers (August 2014) indicates that in a 1% AEP flood event (with Climate Change to 2090) the stopbank adjacent to the Homebush Wastewater Treatment Plant (HWWTP) overtops and inundates the headworks facility (Issue ID 147). However, the base topographic data that was used for this model (2013 LiDAR and stopbank crest survey) was gathered prior to the construction of the new stopbank being completed. The hydraulic model is currently being updated with the as-built survey of the new stopbank and incorporating the thorough review that has been undertaken of the Waipoua design hydrology. Once this modelling has been completed the flood hazard evident to the headworks can be reviewed and the need for any additional works to improve the resilience of the facility considered. Based on the information currently available it is considered prudent to allow a provisional sum for possible flood mitigation works at the headworks facility.

It is also worth noting that the newly constructed pond embankments are approximately 0.5m higher than the stopbanks so it is unlikely that the ponds would be overtopped during a large (over 1% AEP) flood event.

The current hydraulic modelling also shows that the older (lower) section of stopbank downstream of the landfill (Issue ID 145) overtops in the 1% AEP flood event but the overflow tracks to the west of the the HWWTP in the Makoura Stream. Other issues in this reach relating to erosion hazard to the HWWTP irrigation beds (Issue ID 146) and the discharge point (Issue ID 148) can be managed with the common methods.

The newly upgraded stopbank is constructed on MDC land for the specific purpose of protecting MDC asset but is currently recognised as a GWRC asset. Discussion is ongoing around future maintenance and funding responsibilities for this asset.

Opportunities

The updated modelling results will provide a more accurate assessment of the risks to the HWWTP headworks but there will still be the possibility of the stopbank overtopping in an event larger than the 1% AEP flood or failing during an event lower than a 1% AEP flood due to piping or external erosion. Consideration of these residual risks could also be taken into account when considering options for increasing the resilience of the HWWTP headworks. There is the possibility of integrating the Three Rivers Trail and access to the Ruamāhanga River in this area but there would need to be careful consideration of health and safety and security issues around the HWWTP ponds and headworks.

Relationship with common methods

The other issues highlighted in this reach can be managed with the common methods, specifically the landfill stopbank "Rural stopbanks policy" (Issue ID 145), "Recognition of buffers as a river management tool" (Issue ID 145) and the "Code of Practice" (Issue ID 146&148).

Description

General

A provisional sum for increasing the resilience of the headworks facility, which could include an elevated plinth for the generator and raising electrical devices above flood levels.

Costs -\$50,000 (Provisional sum – subject to updated hydraulic modelling)

Implications

Inundation of the HWWTP headworks could result in damage to electrical equipment and the screens being overwhelmed, which would cause untreated wastewater to be discharged to the river.

Priority

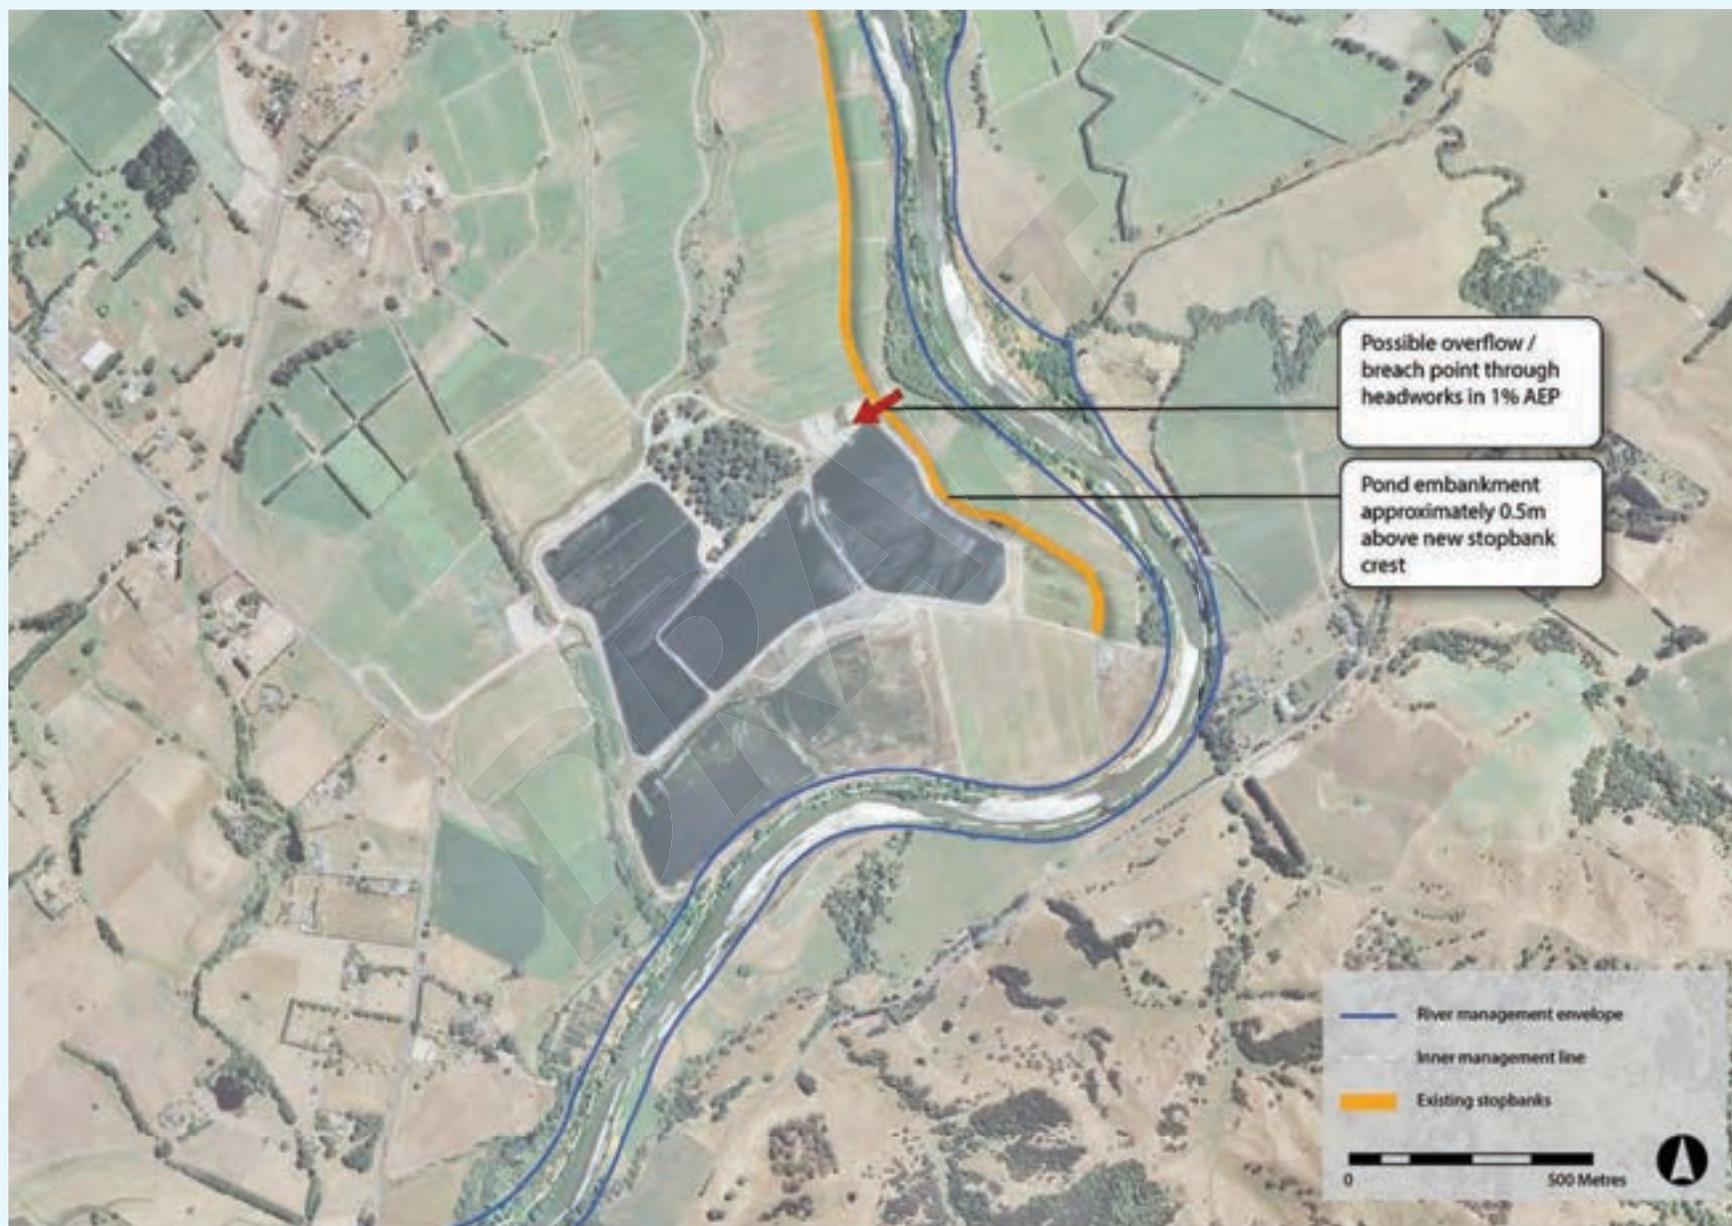

To be reviewed following assessment of modelling.

Level of Service

A 1% AEP level of service is required in HWWTP resource consent.

REFERENCE NUMBER	MANAGEMENT MEASURE	CURRENT LEVEL OF SERVICE	THREATS TO CURRENT LEVEL OF SERVICE	PROPOSED LEVEL OF SERVICE	PRIMARY REASON FOR RESPONSE	RESPONSIBILITY	PRIORITY	COST	FUNDING

Waingawa to Gladstone – Reach 6

Character

Downstream of the confluence of the Waingawa River, the Ruamāhanga River corridor increases in width and continues a broad semi-braided form. The northern part of the river skirts the western slopes of Foster’s Hill before opening out into the Central Plains towards the confluence with the Taueru River to the south. Pockets of remnant native vegetation and willow planting occur inside stop banks established along the eastern river margin.

Key characteristics

Increasingly semi-braided form where waters of the Waingawa and Ruamāhanga Rivers combine

Stop banks enclosing remnant native and willow planting

Values

This reach flows through rural land used for primary production and predominantly established in pasture grassland. Stopbanks occur along this reach, some of which enclose native vegetation along the river margin, and result in a medium / high level of modification whilst retaining a medium level of scenic value.

Kayaking and fishing are popular along this reach, taking advantage of the pools, runs and riffles which occur. Jet boating access occurs in this reach, which is a popular area valued for having a semi-braided form which frequently changes course and offers new opportunities to ‘read’ a different course of navigation along the river. Several swim sites are also located along this reach including areas also associated with jet boat access at Gladstone Bridge.

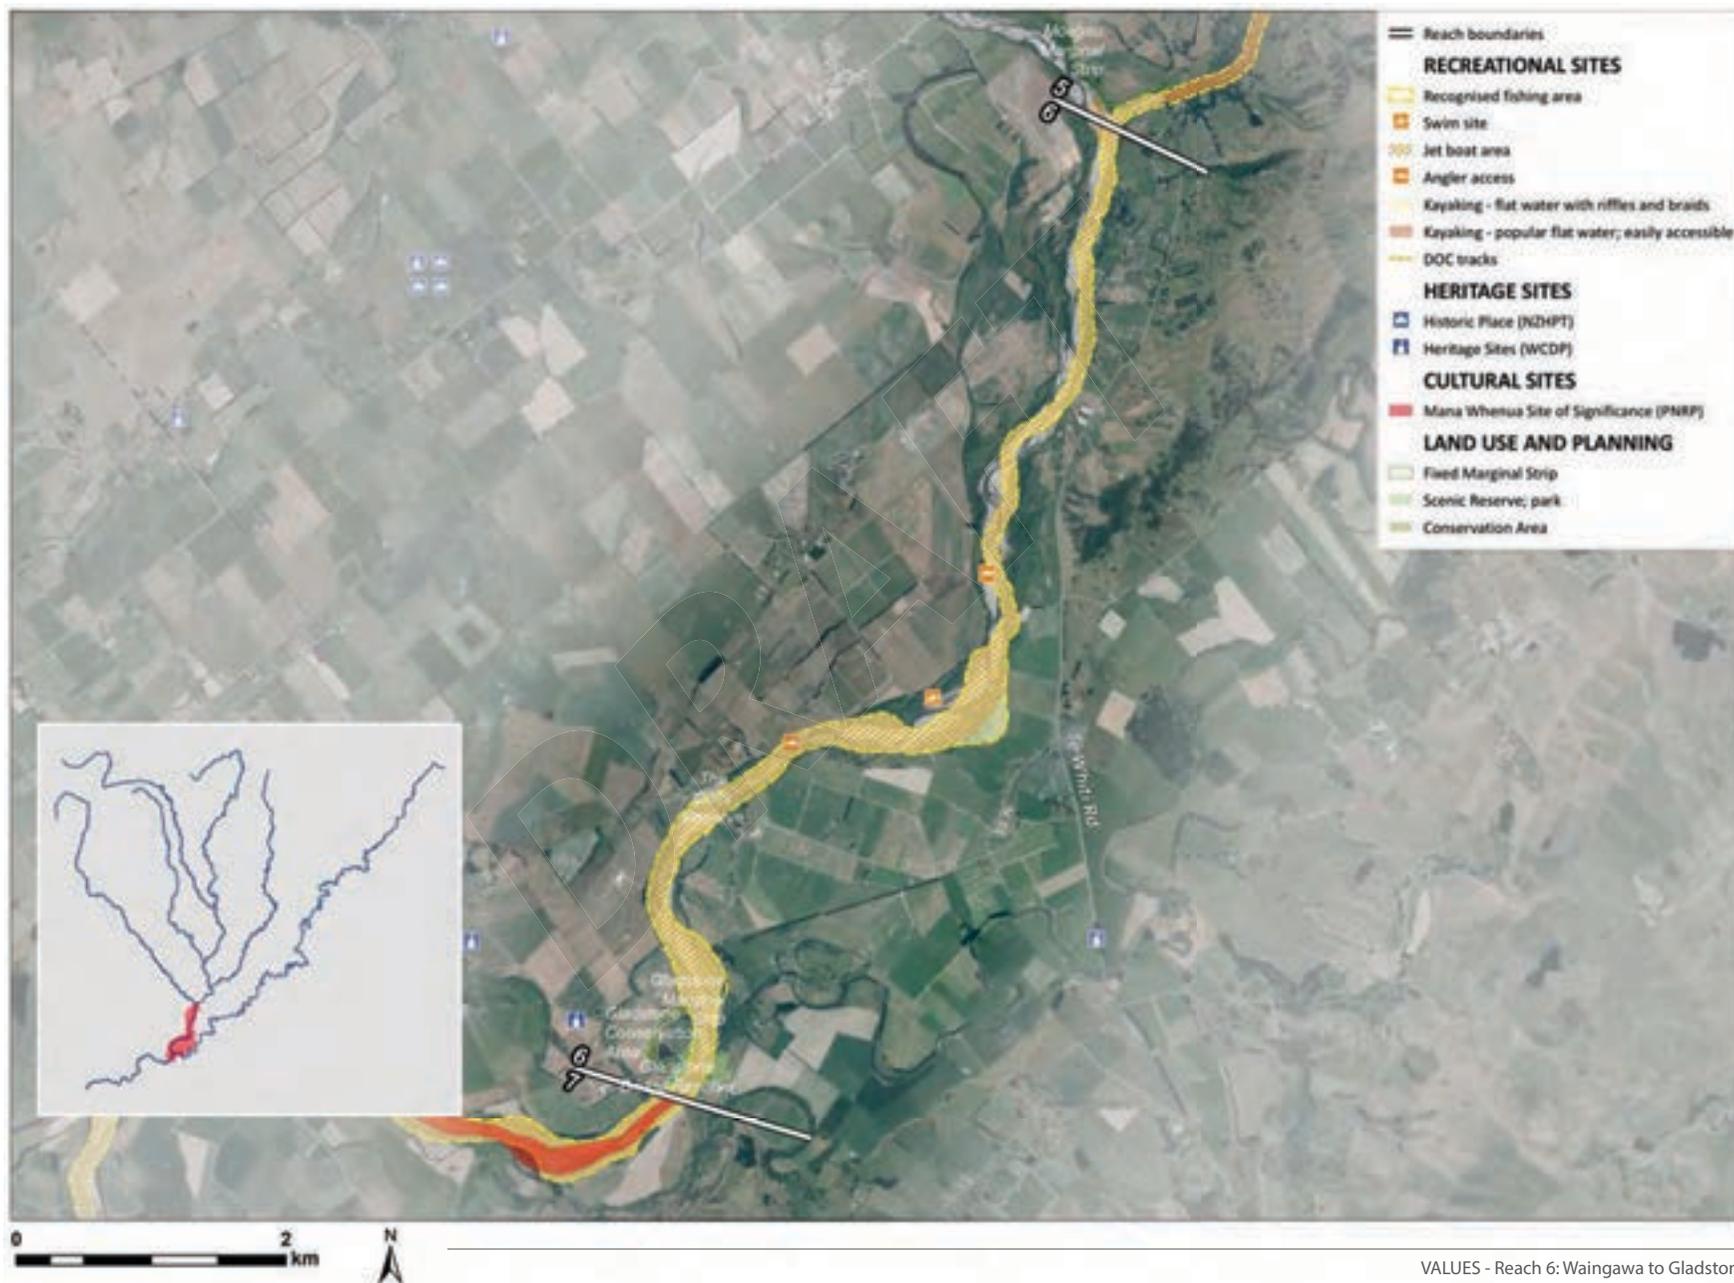

Important ecological values along this reach include an indigenous forest remnant along the Martinborough Masterton Road (Ruamāhanga River Terrace RAP), together with terrestrial habitats which encompass areas of unfenced indigenous forest, mixed exotic-indigenous forest and indigenous treeland. Important habitat for banded dotterels, black-fronted dotterels and pied stilts also occurs in association with broad stonefield and boulderfield river margins.

Several cultural sites occur along this reach including waahi tapu associated with the mixing of waters from different rivers, an historic house site and an historic spring. Gladstone Inn is also a heritage site identified in the WCDP to the east of Gladstone Bridge.

Key Floodplain Management Points

- This FMP will shift the focus of river maintenance towards more intensive implementation of vegetated buffers. The design buffers will be allowed to erode when and where appropriate. This method will substitute the immediate response to erosion issues with the machinery in channel works practiced in the past.
- This FMP will address the issues associated with scheme stopbanks and increase river enhancement works.
- Protect the Ruamāhanga River Terraces RAP site from negative impacts of flooding and erosion.
- Recognise the importance of the confluence of the Taueru and Ruamāhanga Rivers and the Waingawa confluence.
- Work with the asset owner of the Gladstone Bridge to protect and maintain its operation.
- Work with Carterton District Council to continue the management of erosion risk to Dakins Road.

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES

Ruamāhanga River Terrace (RAP), Unfenced indigenous forest, Mixed exotic-indigenous forest, Indigenous treeland, Stonefield and boulderfield, Natural wetlands and ponds

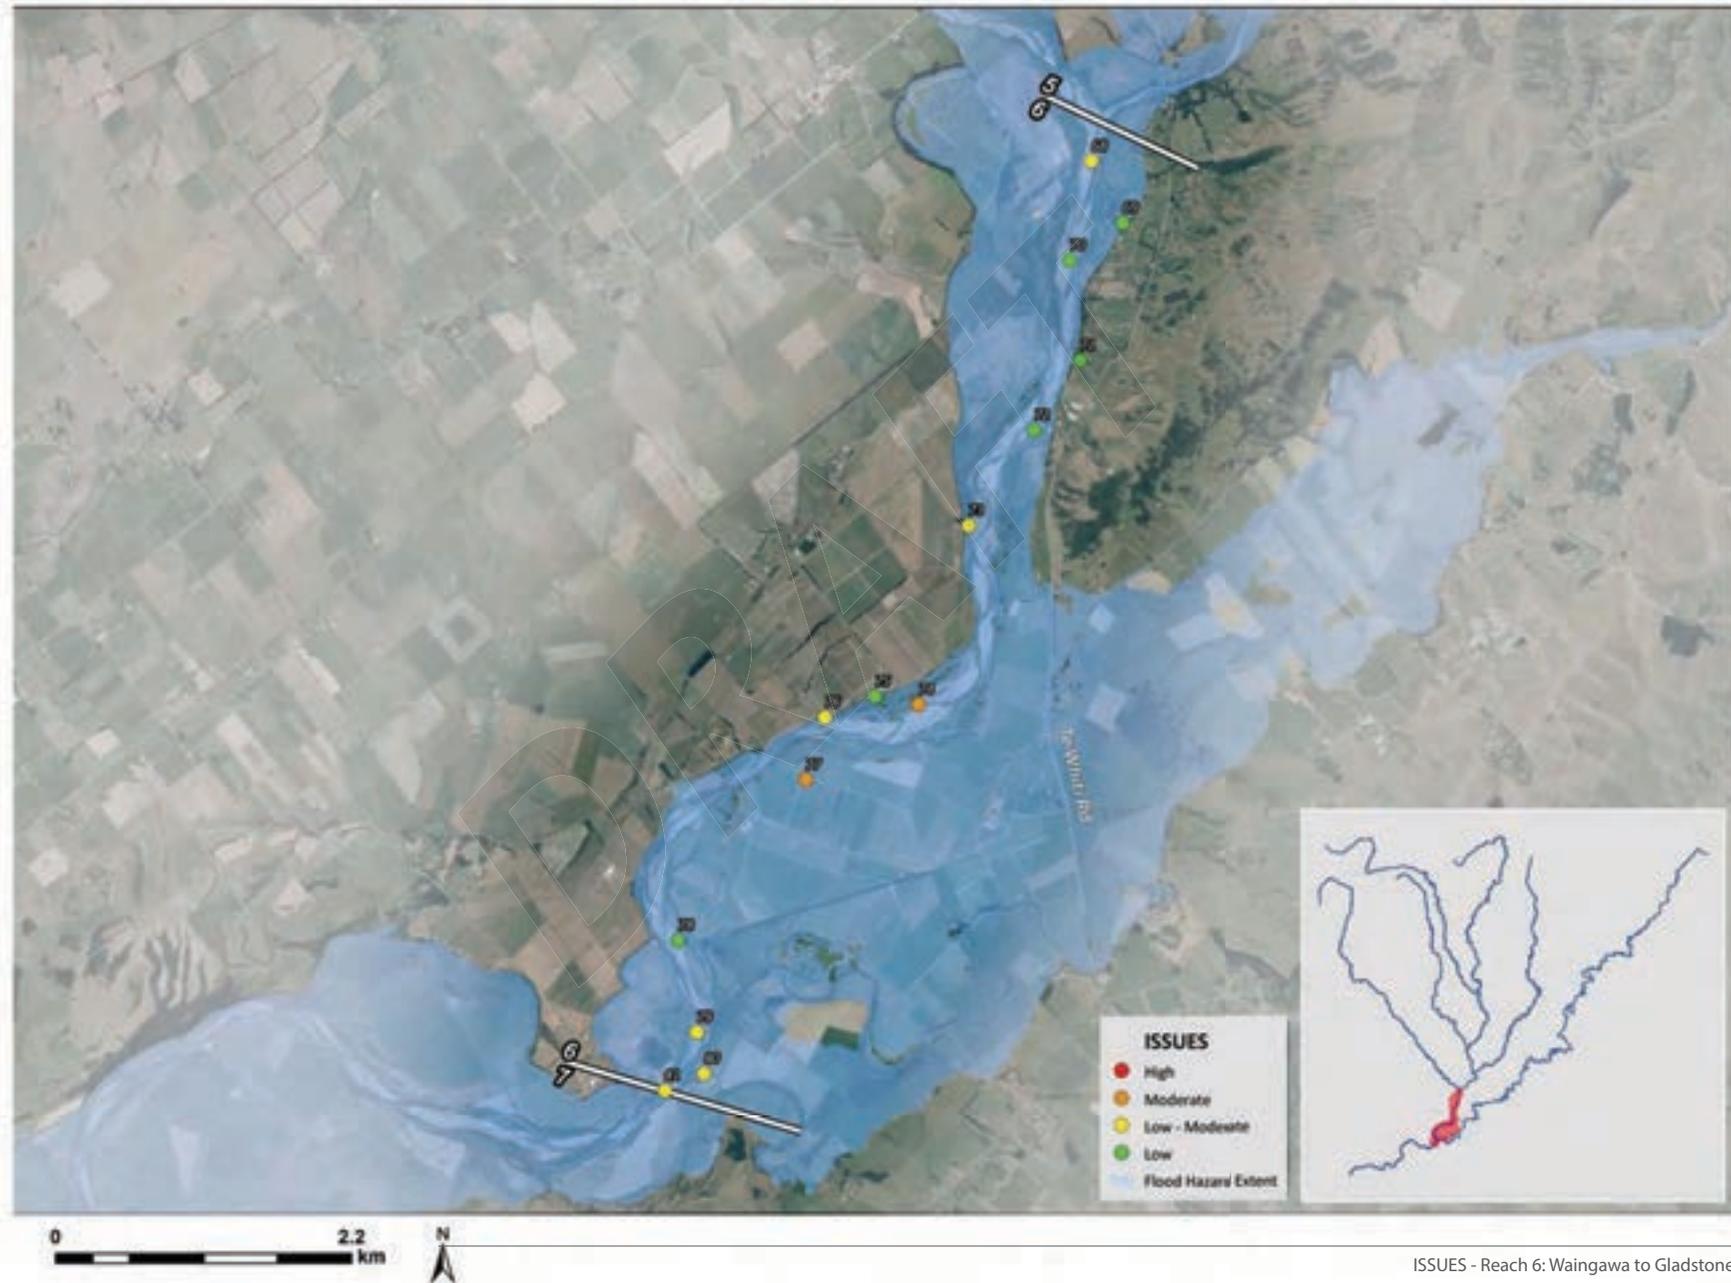

Waingawa to Gladstone – Reach 6

Flood and erosion issues

A total of 12 flood and erosion issues are identified along this reach. Issues have been ranked according to their consequence and likelihood (i.e. risk) and assigned an ID number [xx].

LOW	<p>Ruamāhanga River Terrace RAP site [69] The RAP site sits on the edge of the 1% AEP flood extent and within the erosion study area.</p> <p>Channel alignment [70] The channel through this area is naturally wider than the design channel alignment.</p> <p>Houses [71] Several houses are located within the erosion study area; however, they sit on a relatively firm terrace which is resistant to erosion effects.</p> <p>Channel alignment [72] The channel in this area tends towards being wider than the design channel. This creates challenging management issues, and puts pressures on the buffer strips on both banks of the river.</p>	<p>Channel alignment [78] The buffer widths upstream of the confluence with the Taueru are too narrow and have created ongoing management concerns.</p> <p>Fish habitat [75] A number of small springs or backwaters in this area are known to have provided fish habitat over a long period of time. They are affected by erosive forces but are currently well protected within a buffer area.</p>
LOW TO MODERATE	<p>Waingawa and Ruamāhanga confluence [68] Unstable flows caused by the meeting and mixing of the Waingawa and Ruamāhanga Rivers makes the confluence area a challenging location to manage. Gravel deposition also needs management.</p> <p>Frost protection water intake [73] The water intake is threatened by ongoing erosion effects. The landowner has provided some of their own erosion protection to protect the structure.</p> <p>Dakins Road [76] Erosion affecting the end section of Dakins Road, near Cottier Estate has been addressed in past with rock works. These rock works have protected the immediate area they were installed to protect, but adjacent areas are still affected by erosion.</p>	<p>Fish passage [79] The confluence area of the Ruamāhanga and Taueru Rivers is important for fish passage which is prone to being disrupted by natural or artificial sediment/gravel movements.</p> <p>Gladstone complex [80] The Gladstone complex includes a pub, several houses and a sports field. It sits within the erosion study area and the 1% AEP flood extent and has a known history of flooding. There is no known history of erosion in this area.</p> <p>Gladstone Bridge [81] There are no currently known issues with this bridge. An exclusion zone for extraction exists 100m upstream and downstream from the bridge. The bridge design is not believed to be particularly vulnerable to debris flows, and it has adequate freeboard to its soffit.</p>
MODERATE	<p>River alignment [74] The channel needs ongoing and frequent management. Failure to do this means the river spills extra water onto Te Whiti flats and increases the risk of the Te Whiti stopbank overtopping.</p>	<p>Te Whiti stopbank [77] The stopbank sits within the erosion study area and in some sections within the buffer areas of the current management scheme. There is risk of erosion reducing the effectiveness of the stopbank. It was reported that this stopbank was overtopped in a 20% AEP event in 2009/2010.</p>
HIGH

Gladstone to Kokotau Bridge – Reach 7

Character

To the south of Gladstone Bridge, this reach forms a threaded single channel within a semi-enclosed farmed valley, which extends between Tiffen Hill and the Eastern Wairarapa Hills. The Gladstone cliffs form a prominent backdrop along the eastern banks of this reach before the river swings west towards the base of Tiffen Hill. Willow planting has been used along much of the river margin, with pockets of regenerating indigenous vegetation also established along the base of Tiffen Hill.

Key characteristics

Semi-enclosed valley form to the east of Tiffen Hill

Proximity between river and Gladstone Cliffs

Mix of willow planting, gorse or broom shrubland and regenerating indigenous forest

Key Floodplain Management Points

- This FMP will shift the focus of river maintenance towards more intensive implementation of vegetated buffers. The design buffers will be allowed to erode when and where appropriate. This method will substitute the immediate response to erosion issues with the machinery in channel works practiced in the past.
- This FMP will address the issues associated with scheme stopbanks and increase river enhancement works.
- Improve the awareness and facilitate the use of Carter Reserve access.

Values

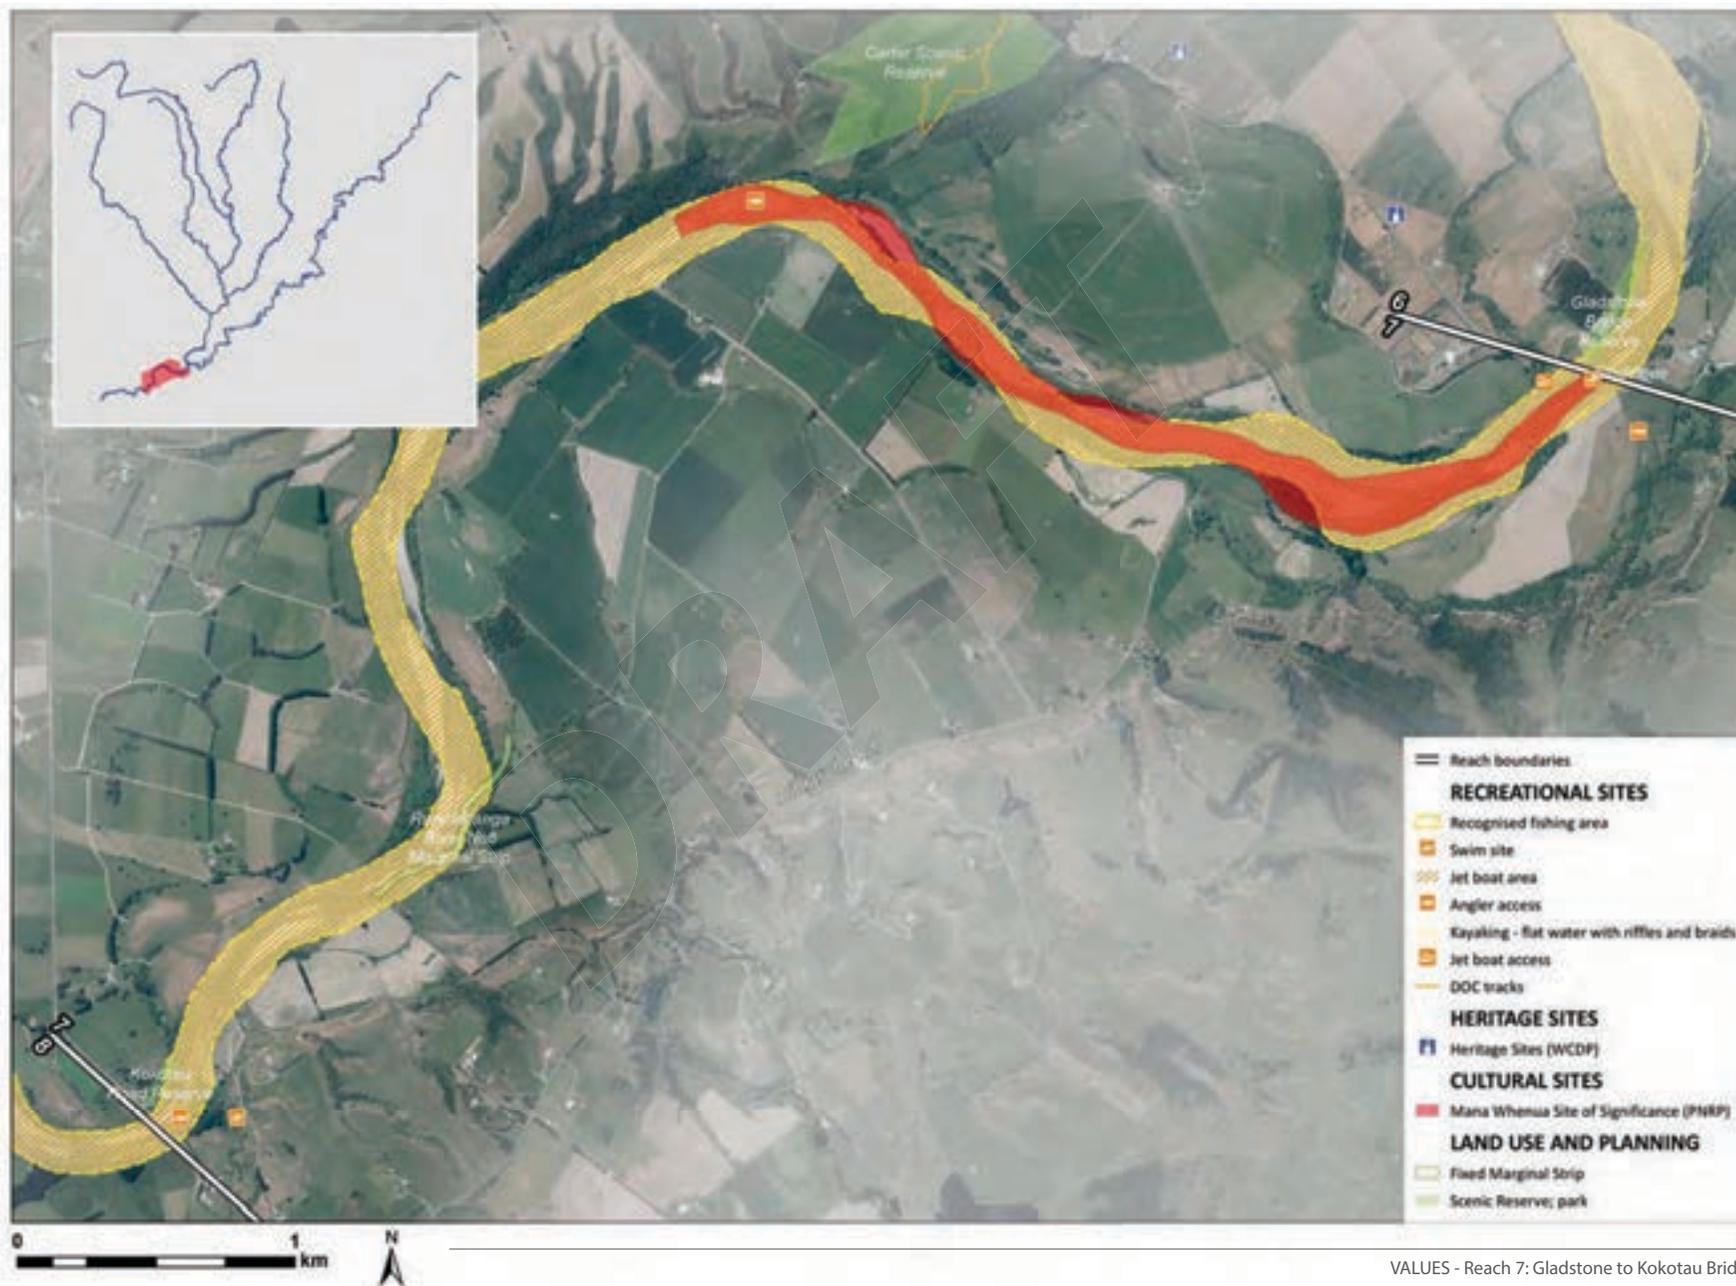

This reach flows through rural land used for primary production and predominantly established in pasture grassland. Some willow planting has been established along the margins of the river in association with stopbanks north of Tiffen Hill. More natural patterns of regenerating indigenous forest are also established near the toe of Tiffen Hill. This results in a medium level of landscape modification overall and a medium / high level of scenic value.

Kayaking is popular in this area on account of the flat water pools, runs and riffles which occur. This environment is also popular for fishing, including rainbow trout and perch. Jet boating continues along this reach from access points located at both Gladstone and Kokotau bridges. Swimming access is also available from picnic areas adjoining these road bridges, with recreation access recently formalised at Carters Reserve.

Terrestrial habitats with ecological value identified in this area include areas of fenced and unfenced indigenous forest, mixed exotic-indigenous forest, indigenous treeland, stonefield, boulderfield, natural wetlands and ponds.

Several cultural sites occur along this reach including a marae, a historic pā site, urupa sites, Parakuiti, a taniwha lair and associations with mahinga kai.

Kokotau Bridge to Waiohine – Reach 8

Character

Below Kokotau Road Bridge the Ruamāhanga River re-enters the wider Masterton Plains to the south and flows around the northern toe of Pukengaki. A single thread channel along a contained gravel corridor continues through this reach. The majority of this river reach is enclosed by continuous bands of willows established along the river margin, with isolated totara extending into adjoining farmland from the river margins in some areas.

Key characteristics

Single channel along contained gravel corridor within wider Masterton Plains

Predominately willow lined margins

Isolated totara in some areas

Values

This reach continues through rural land used for primary production and predominantly established in pasture grassland. Willow and some areas of pine form continuous bands along the river corridor in association with limited stopbanks and rock groynes. Pockets of remnant totara also extend into adjoining farmland. Overall the river is identified as having a medium level of landscape modification and a medium level of scenic value.

Fishing and kayaking occur in this area taking advantage of the flat water with pools, runs and riffles which occur. Angling for rainbow trout and perch is popular. Jet boating continues south along this reach from the boating access point located at Kokotau Bridge. Swimming sites are also accessed from picnic areas at Kokotau Road and Forman Jury Road.

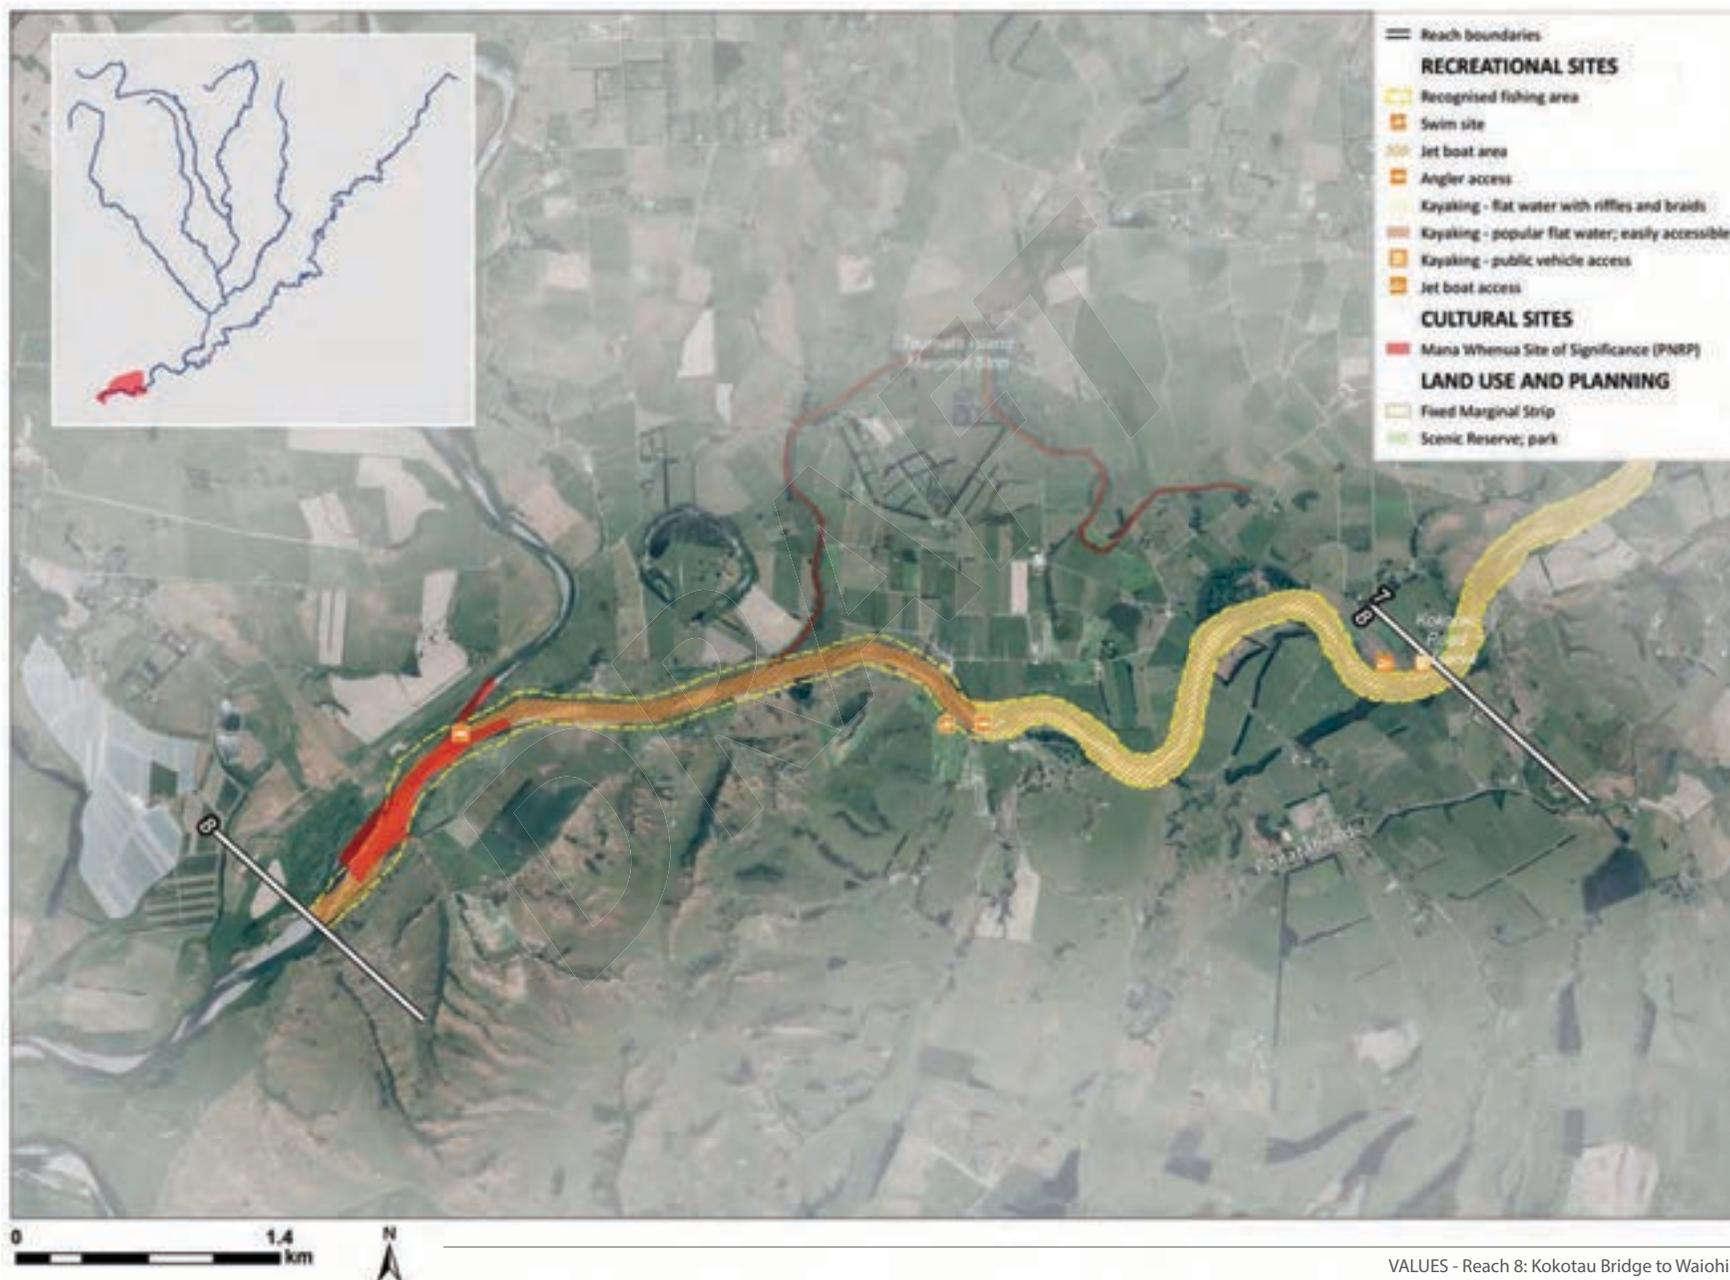

Terrestrial habitats with ecological value which continue along this reach include areas of unfenced indigenous forest, mixed exotic-indigenous forest, indigenous treeland, stonefield, boulderfield, natural wetlands and ponds.

Several cultural sites occur, including the mixing of mauri at the confluence of the Waiohine.

Key Floodplain Management Points

- This FMP will shift the focus of river maintenance towards more intensive implementation of vegetated buffers. The design buffers will be allowed to erode when and where appropriate. This method will substitute the immediate response to erosion issues with the machinery in channel works practiced in the past
- This FMP will address the issues associated with scheme stopbanks and increase river enhancement works
- Work with the asset owner of Kokotau Road Bridge to protect and maintain its operation
- Ensure that decisions regarding flood risk management take into consideration the outcomes of the Waiohine Floodplain Management Plan

RESPONSES - Reach 8: Kokotau Bridge to Waiohine

Waipoua River

7. Waipoua River

The Waipoua River has a catchment area of 149 km², with the main river channel from its headwaters to its confluence with the Ruamāhanga River reaching 30 km in length. The headwaters originate from the Blue Range of the Tararuas, flowing down through steep-sided gorges fringed by native forest. A large part of the catchment is within the lower foothills of the range. The river has three major tributaries: the Kiriwhakapapa Stream, the Mikimiki Stream, and the Wakamoekau Creek. These streams join the river as it flows across the Wairarapa plain, before passing through the Masterton urban area to its confluence with the Ruamāhanga River at Te Ore Ore.

The current Waipoua River Management Scheme covers an 18 km length from Mikimiki Bridge to the Ruamāhanga confluence. The river channel is characterised as a steep gravel phase river with a relatively stable and narrow single thread channel. The Mikimiki reach and Masterton township reach have been straightened, steepened and shortened.

The naming of the Waipoua River is attributed to Haunui-a-Nanaia testing its depth with a stick prior to crossing, with 'wai' meaning water, and 'poua' meaning to plunge a stick in. The banks of the Waipoua housed one of the first Kainga visited by Europeans in the region, the precise location of which is not known.

The siting of Kaikokirikiri Pa close to both the Waipoua and Ruamāhanga Rivers provides an indication that there are cultural values associated with the area. In *Tawera to TeWhiti* (2005), Potangaroa and Rimene refer to Kaikokirikiri as the main pa of the Masterton area, and also note that the Waipoua used to flow at the foot of the pa. The proximity of the pa to the Waipoua River implies that the wider surrounding environment would have been regularly frequented and used for a range of cultural practices.

The Waipoua floodplain soils are formed from greywacke alluvial parent materials from the Tararua Ranges.

General Issues

The Waipoua is a river of multiple characters. In large flood events, it can be devastating. The river channel itself is fairly entrenched, but of relatively small capacity – only smaller floods can be contained without spilling water out on the floodplain in the rural areas. The erosion risk posed by the Waipoua River flows is smaller than for the other gravel rivers in the project area.

Of all rivers in the Wairarapa, flooding of the Waipoua has the potential to affect most people. The Waipoua River has been modelled as flooding northern Masterton in a large event, affecting approximately 2000 properties, and potentially flooding into 300 homes. There are areas of the northern bank close to Oxford Street with potentially very high flood water levels. There are also security issues of existing stopbank upstream of Masterton.

Additional locations that fall within or close to an identified hazard include the Massey University Riverside property, Mikimiki bridge, and the Mahunga golf course.

The Waipoua River also shares the three key gravel river management issues noted in the Ruamāhanga River section, namely:

- Degradation/aggradation
- Inconsistency in community acceptance of current erosion management practices
- The value of the rivers for recreation and habitat conflicts at times with river management works (the Masterton reach of the Waipoua River is heavily used for water-based and riverside recreation)

Waipoua Headwaters – Reach 9

Character

The Waipoua headwaters form from a small stream which flows from an enclosed steep native bush clad gully within the Tararua Forest Park and through the adjoining largely inaccessible grazed foothills. Patterns of vegetation typically reflect changes in grazing practice. Limited recreation occurs in the Tararua Ranges which adjoin this area outside the Forest Park.

Key Characteristics

Small stream in bush lined gully

Isolated foothills stream

Values

The Waipoua headwaters form a steep enclosed tributary stream, which flows through fenced and unfenced indigenous forest on the edge of the Tararua Forest Park, prior to extending into land used for rural primary production and predominantly established in pasture. There is a low level of landscape modification overall with medium to high scenic value.

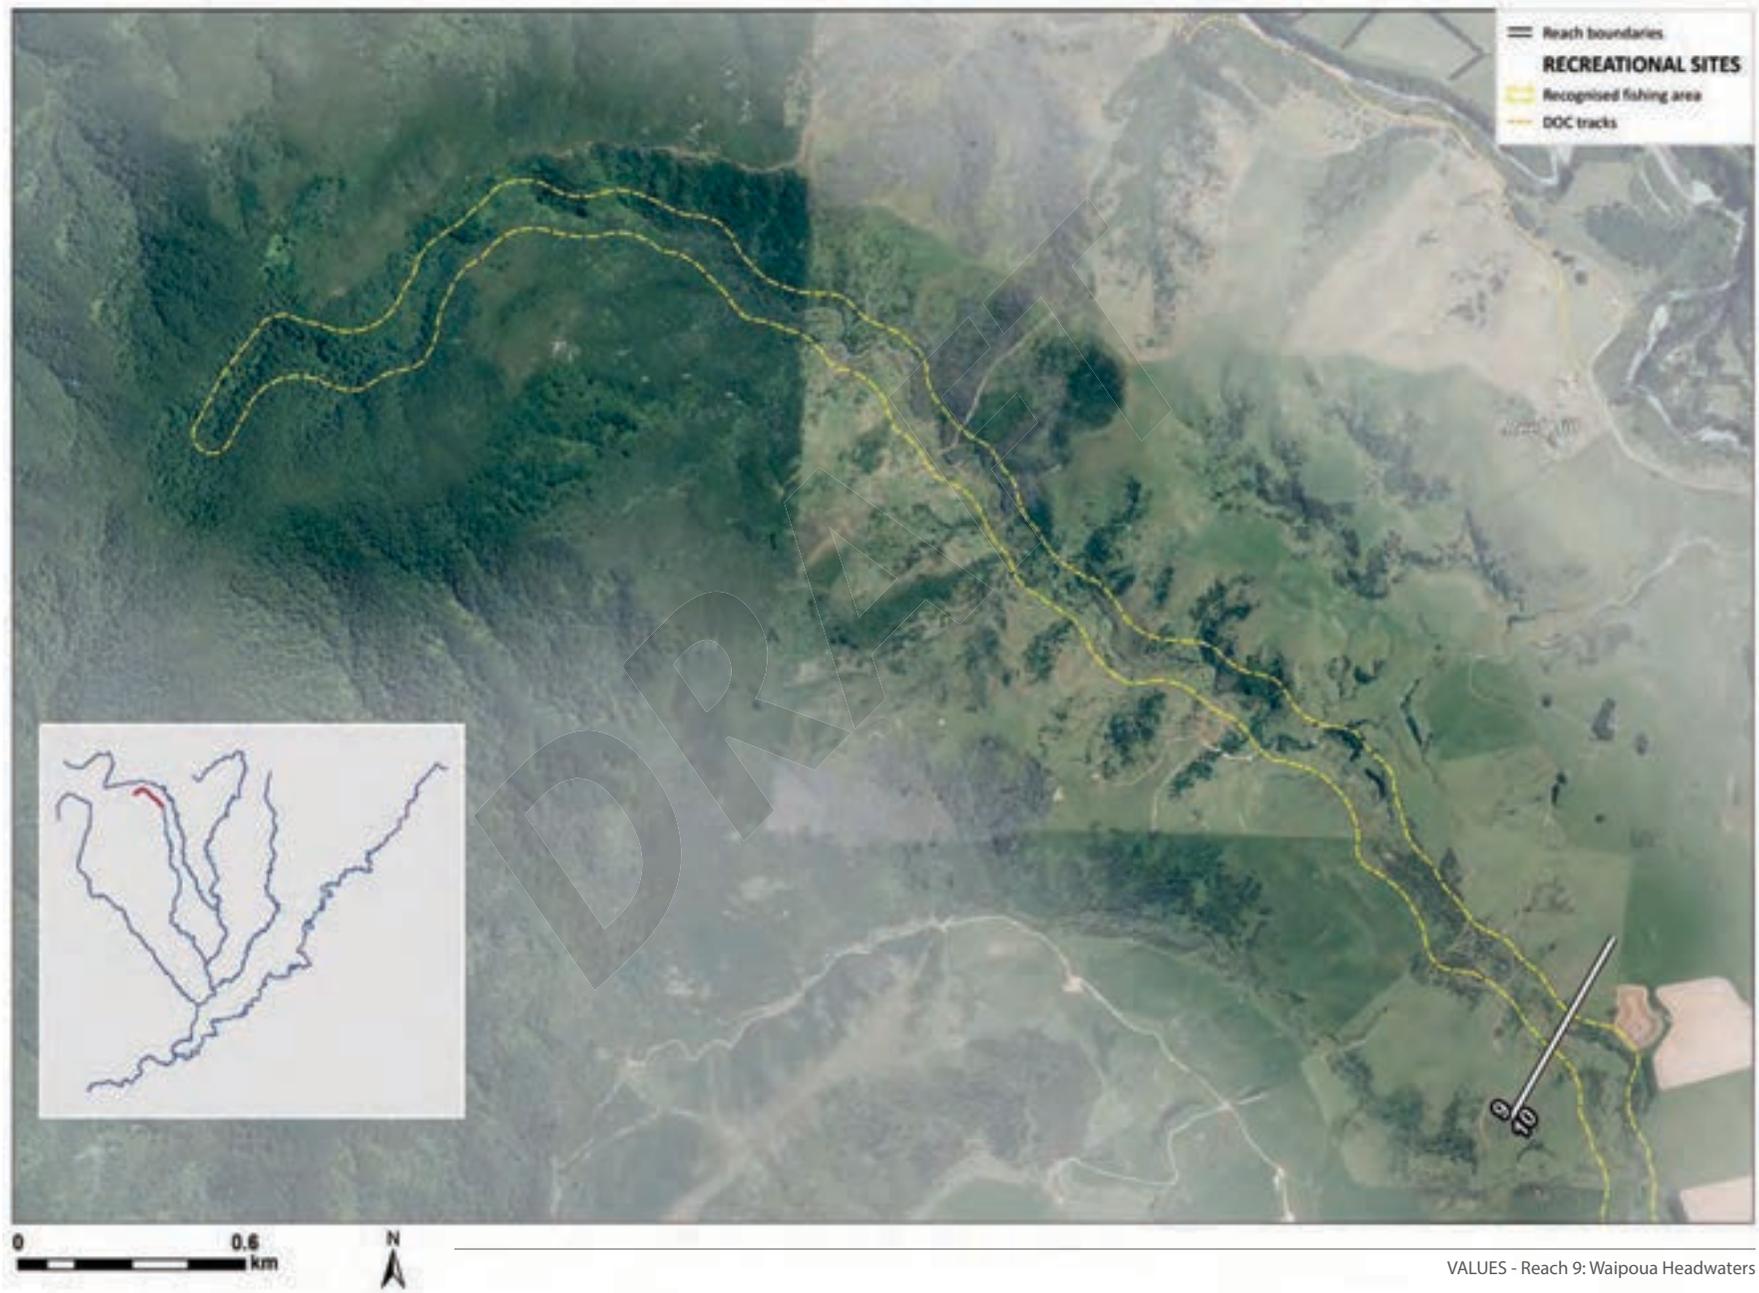

Key Floodplain Management Points

- Encourage continued recognition of the values and character of this reach
 - Support initiatives that aim to preserve or improve the natural values of this reach
- There is no intent to carry out any form of maintenance activity within this reach as part of the Floodplain Management Plan. There are no specific flood and erosion issues identified for this reach.

Reach Specific Responses

	ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES
COMMON METHODS	Entire reach		River management	Isolated works support, Code of Practice
	Entire reach		Planning and policy	Protection against deforestation in upper catchment
	Entire reach		Emergency management	Emergency management planning, flood forecasting and warning system
	Entire reach		Environmental enhancement	Community Support Officer

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES
LANDSCAPE MODIFICATION	SCENIC VALUE					
Low	Medium / High	Fishing	-	-	Rural (Primary Production), Road.	Fenced indigenous forest, Unfenced indigenous forest

VALUES - Reach 9: Waipoua Headwaters

Upper Waipoua – Reach 10

Character

This reach forms a meandering stream which transitions from the foothills of the Tararua Ranges onto the western edge of the Upper Wairarapa Plains to the Mikimiki Road bridge. As the Waipoua flows south, regenerating native vegetation gradually recedes as grazing becomes prevalent along the river margins. River terraces and cliffs are evident in some areas.

In the lower parts of this reach, areas of planting tend to be separated from the river margins, generating linear shelter belts along paddock boundaries. Wetlands separated from the main river are also common throughout this area.

Key Characteristics

Transition from a small stream in vegetated foothills into a small river along grazed valley floor

Localised cliffs, river terraces and rock banks

Linear shelter planting separated from meandering river course

Key Floodplain Management Points

- Apply isolated works policy to this reach, since no river scheme is established in this reach

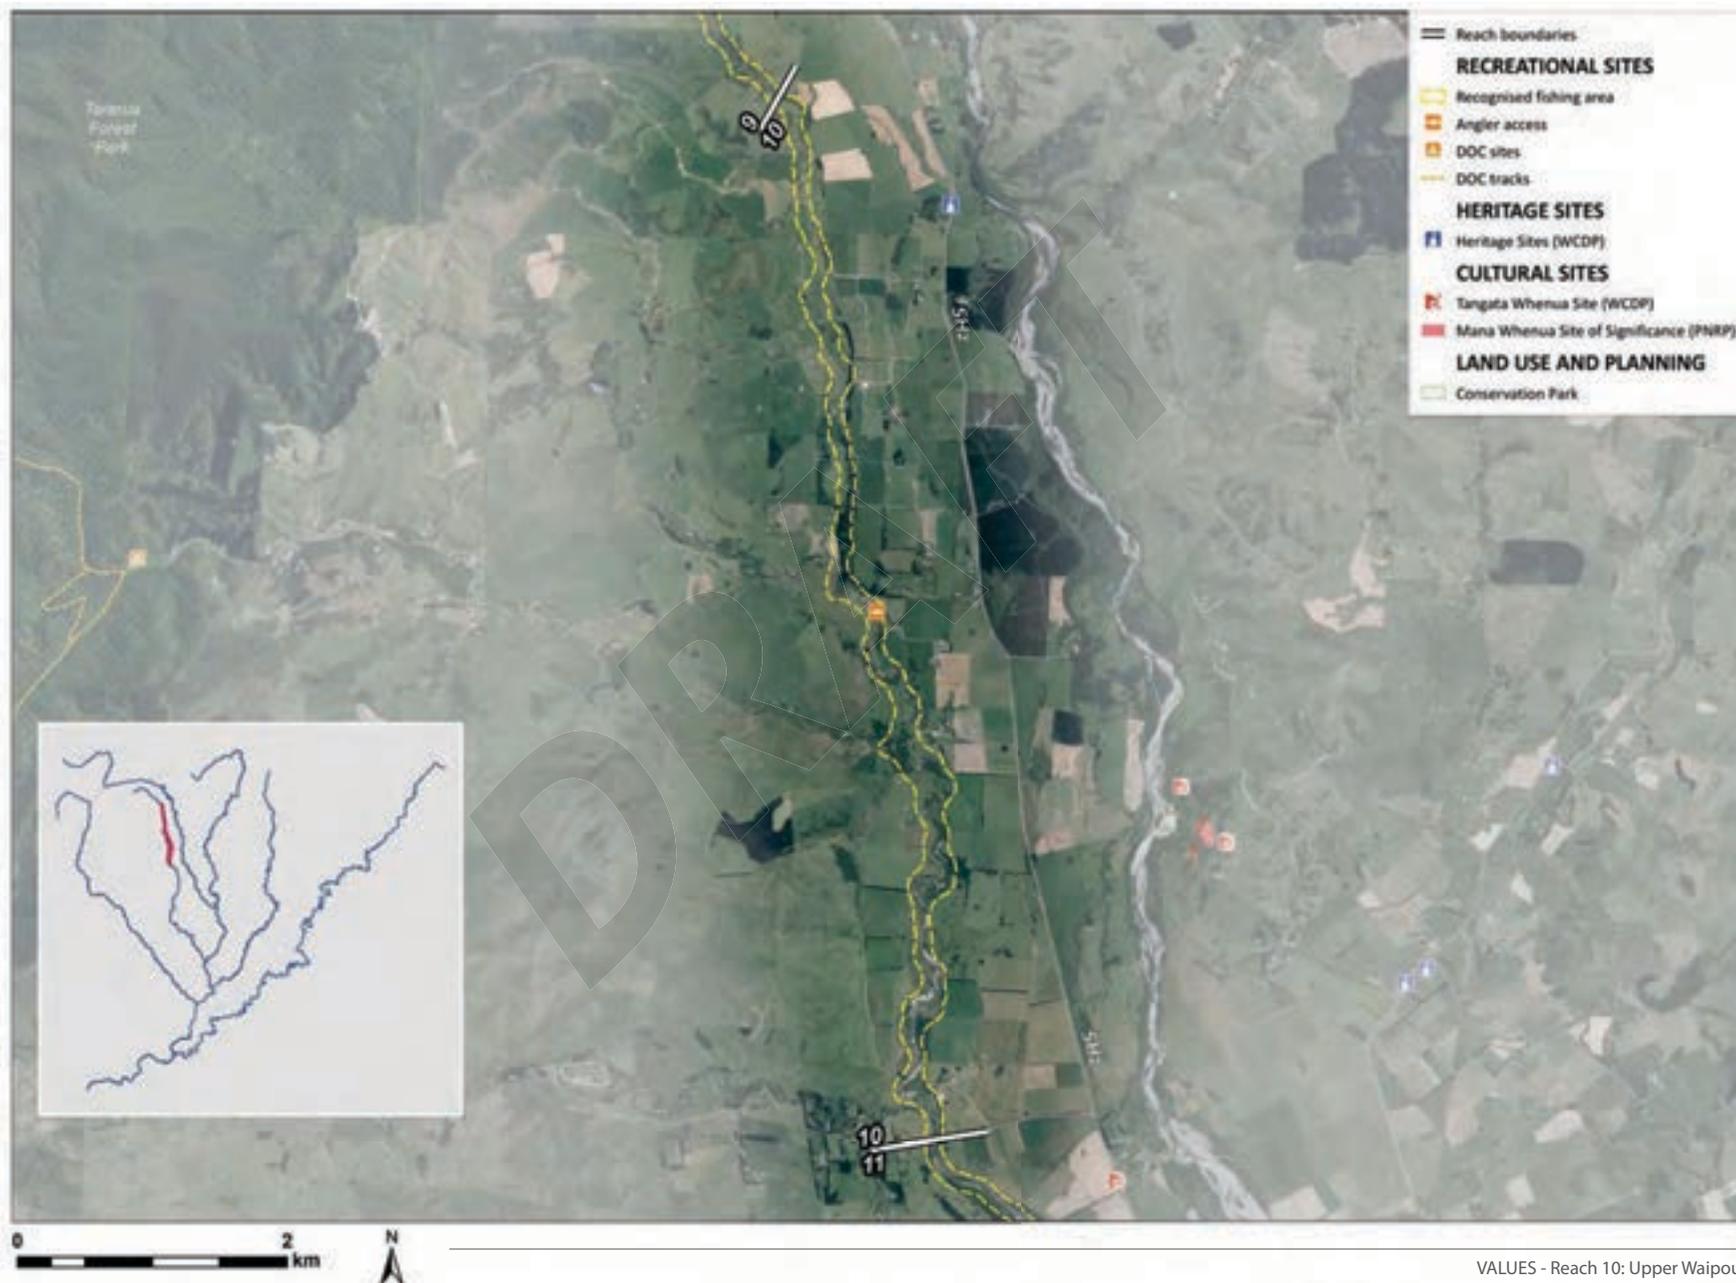

Values

This reach continues through rural land used for primary production and predominantly established pasture. The course of the river retains a meandering form with gravel beaches, pools and riffles, and flows through rolling farmland. It has a low level of landscape modification overall and medium to high scenic value.

Good early season fishing is identified along this reach of river, with access obtained from Kiriwhakapapa and Mikimiki Road Bridges and by negotiation with private land owners.

Terrestrial habitats with ecological value identified along this reach include areas of unfenced indigenous forest, mixed exotic-indigenous forest, indigenous treeland, stonefield, boulderfield, natural wetlands and ponds.

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES
LANDSCAPE MODIFICATION	SCENIC VALUE					
Low	Medium / High	Angler access, fishing	-	-	Rural (Primary Production), Rural (Special), Road, River.	Unfenced indigenous forest, Mixed exotic-indigenous forest, Indigenous treeland, Stonefield and boulderfield, Natural wetlands and ponds

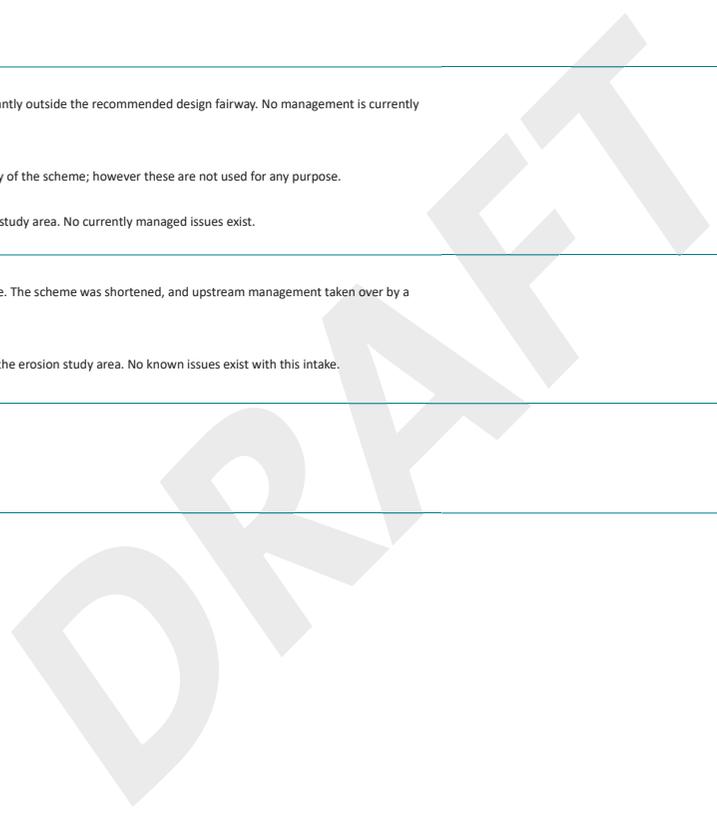

VALUES - Reach 10: Upper Waipoua

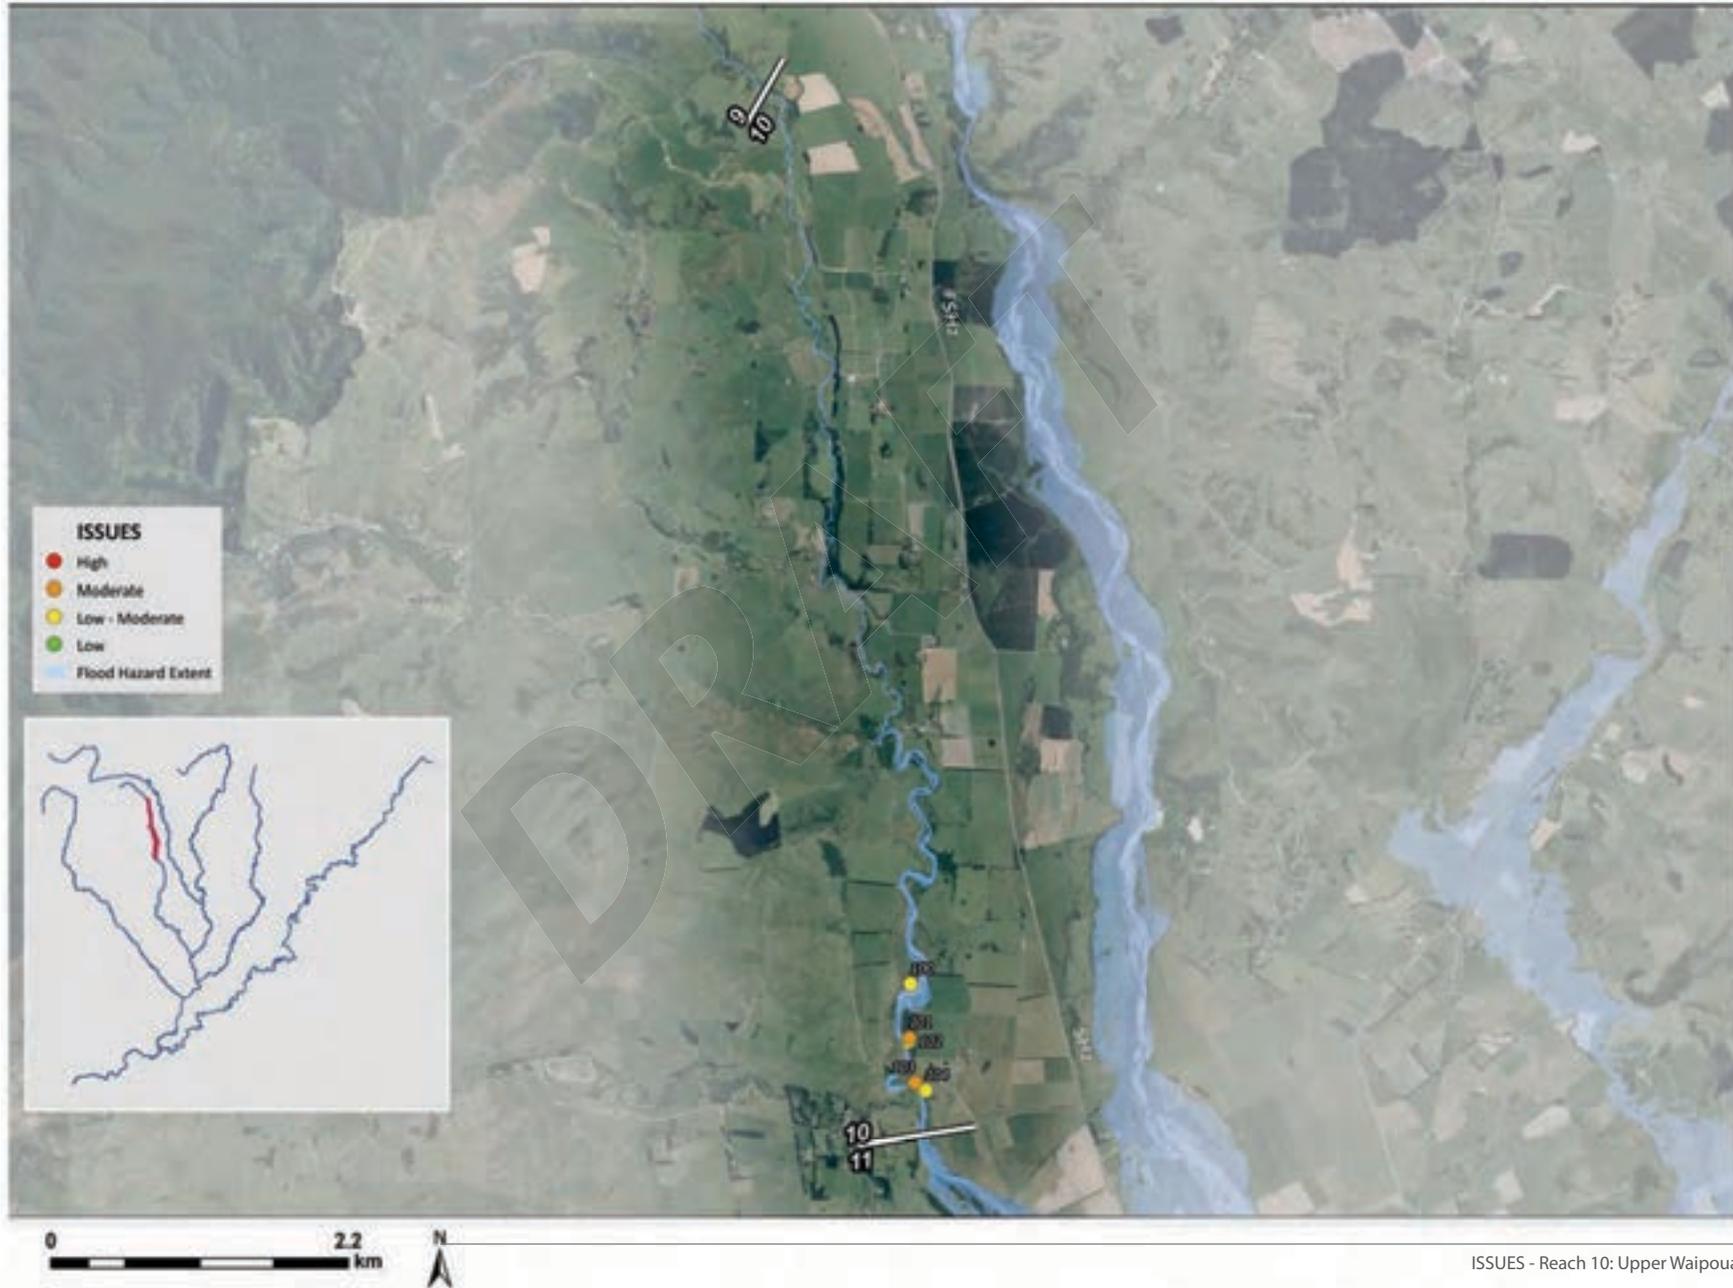

Upper Waipoua – Reach 10

Flood and erosion issues

Five flood and erosion issues have been identified along this reach. Issues have been ranked according to their consequence and likelihood (i.e. risk) and assigned an ID number [xx].

LOW	
LOW TO MODERATE	<p>Channel alignment [100] The channel alignment near the lower end of this reach is significantly outside the recommended design fairway. No management is currently carried out by GWRC in this area, and it is maintained privately.</p> <p>Design channel alignment [102] Design channel alignments extend beyond the upstream boundary of the scheme; however these are not used for any purpose.</p> <p>Massey Farm sheds and bridge [104] Several farm buildings and an access bridge sit within the erosion study area. No currently managed issues exist.</p>
MODERATE	<p>Scheme boundary extent [101] The scheme used to extend further upstream than Mikimiki Bridge. The scheme was shortened, and upstream management taken over by a private organisation.</p> <p>Massey Farms water irrigation intake [103] The intake for the irrigation systems for Massey Farms sits within the erosion study area. No known issues exist with this intake.</p>
HIGH	

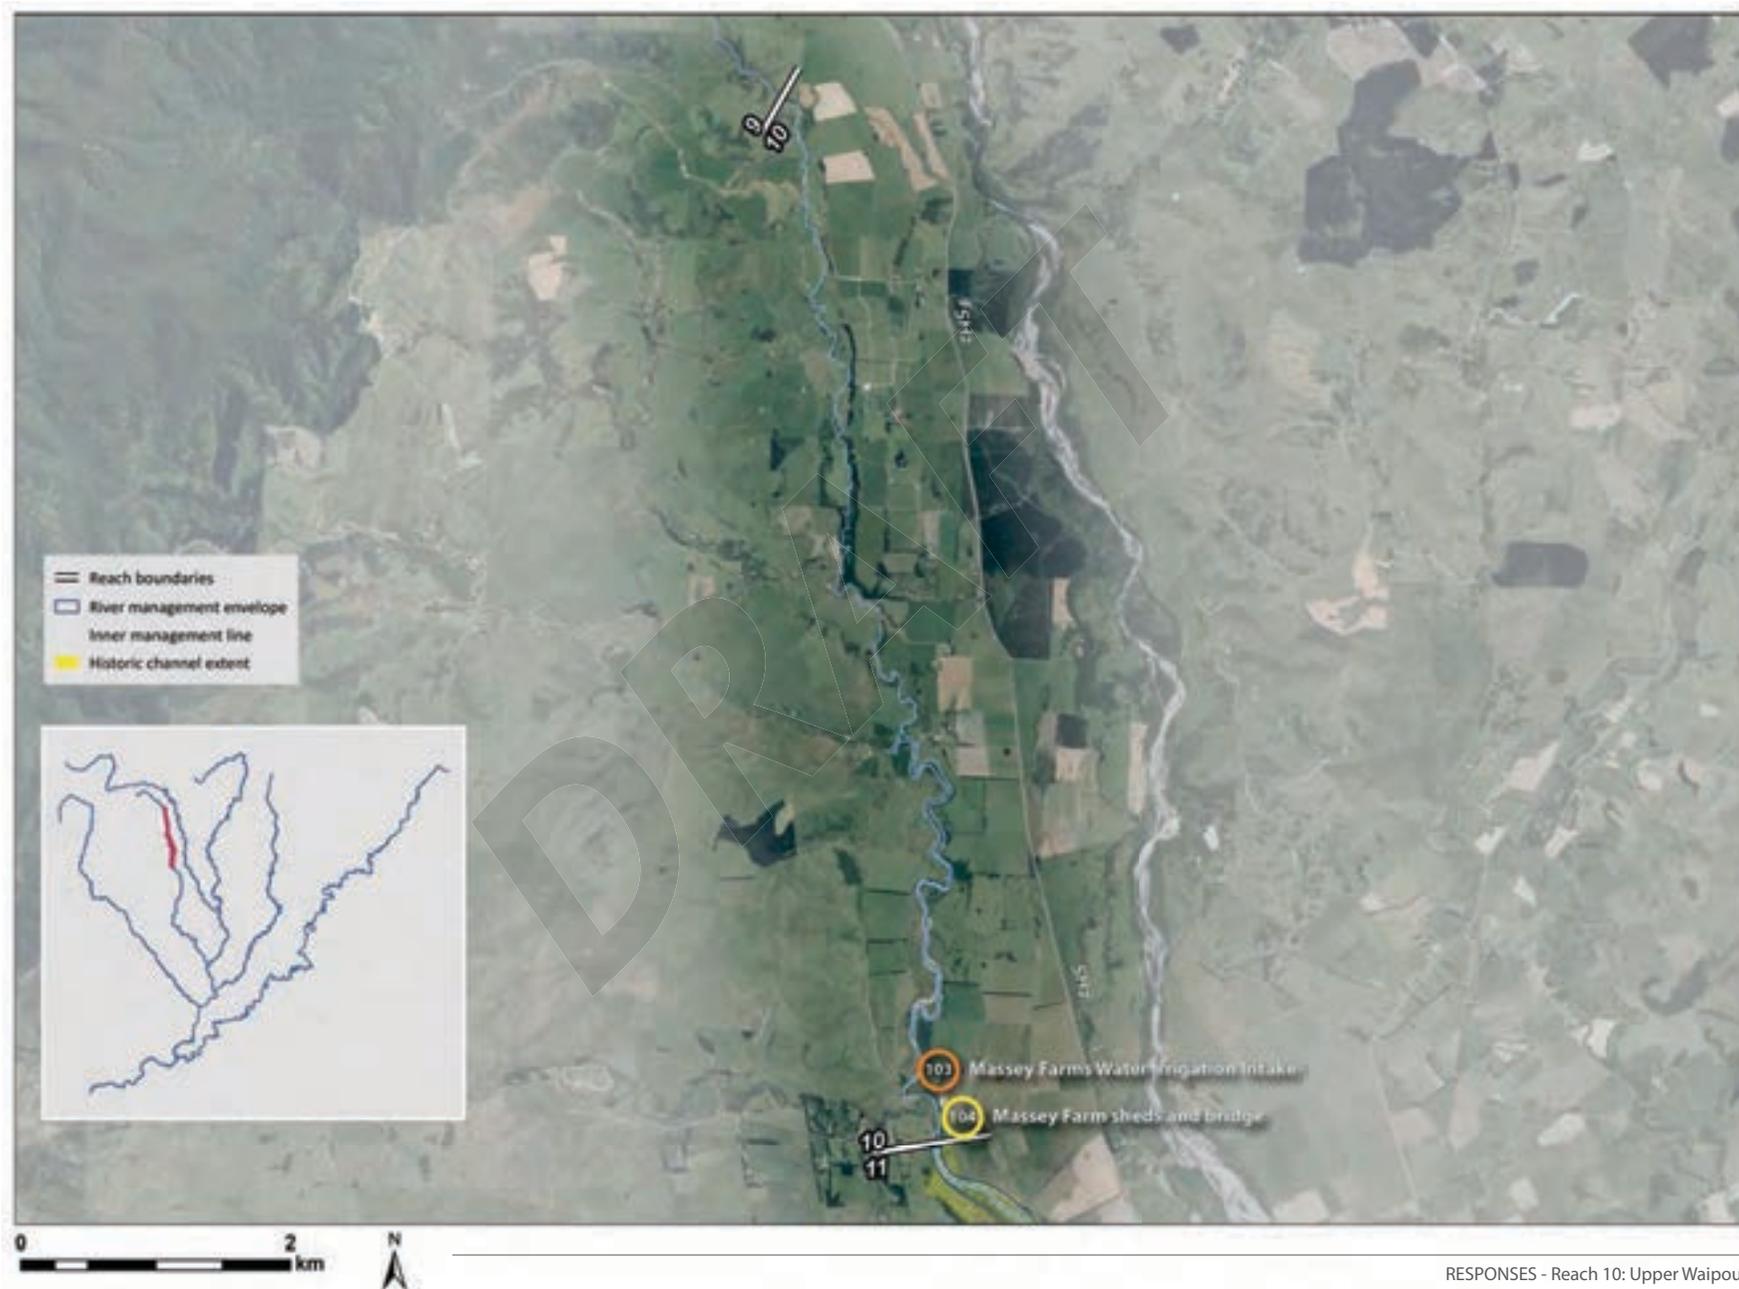

Upper Waipoua – Reach 10

Response

Common methods and specific responses that apply to this reach are set out below. The common methods used to address specific issues are listed in *Appendix 5*.

	ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES	LEVEL OF SERVICE (AEP)		RESPONSIBILITY		PRIORITY
					CURRENT	TARGET	PRIMARY	SECONDARY	
SPECIFIC RESPONSES	104	Massey Farm sheds and bridge	River management	Communicate the potential risk to landowner, continue monitoring the site			Landowner	GRWC	Low
	103	Massey Farms water irrigation intake	River management	River management envelopes will contribute to security of private water takes. Private water takes will have low risk of damage up to a 20% AEP event. Damage to structures is more likely up to a 5% AEP event. Communicate risk to the landowner.		20%	Landowner	GRWC	Low
COMMON METHODS	Entire reach		River management	River edge envelope, river bed level monitoring, recognition of buffers as a river management tool, pool-riffle-run envelope, historic channel lines, isolated works support, Code of Practice, mixed vegetation planting, alternative land uses within planted buffers					
	Entire reach		Planning and policy	Land use controls, flood hazard maps, rural stopbank policy, scheme decision policy, abandonment/retirement of assets, land access & strategic land purchase					
	Entire reach		Emergency management	Emergency management planning, community resilience, flood forecasting and warning system					
	Entire reach		Environmental enhancement	Environmental strategy, Community Support Officer, care group and clubs					

Mikimiki – Reach 11

Character

To the south of Mikimiki Road Bridge the river straightens along the toe of the Tararua Foothills. Along this reach, much of the river follows a single channel across bedrock and gravel. The margins of the river are typically shaded by steep banks accommodating narrow bands of mixed willow, poplar and kowhai. Scattered remnant totara are also common throughout adjoining areas of farmland.

Key characteristics

Single straightened thread along toe of Tararua Ranges

Steep shaded river banks with continuous margins of mixed willow, poplar and kowhai

Scattered remnant totara dispersed through adjoining farmland

Values

This reach continues through rural land, which is predominantly pasture. Some beach re-contouring is carried out, and mixed exotic and native planting extends along the river margin, which has been fenced off from adjoining areas of farmland. This has resulted in a medium level of landscape modification overall whilst retaining medium to high scenic values.

Good early season fishing continues along this reach of river, with access obtained from Mikimiki Road Bridge and in other areas by negotiation with private land owners.

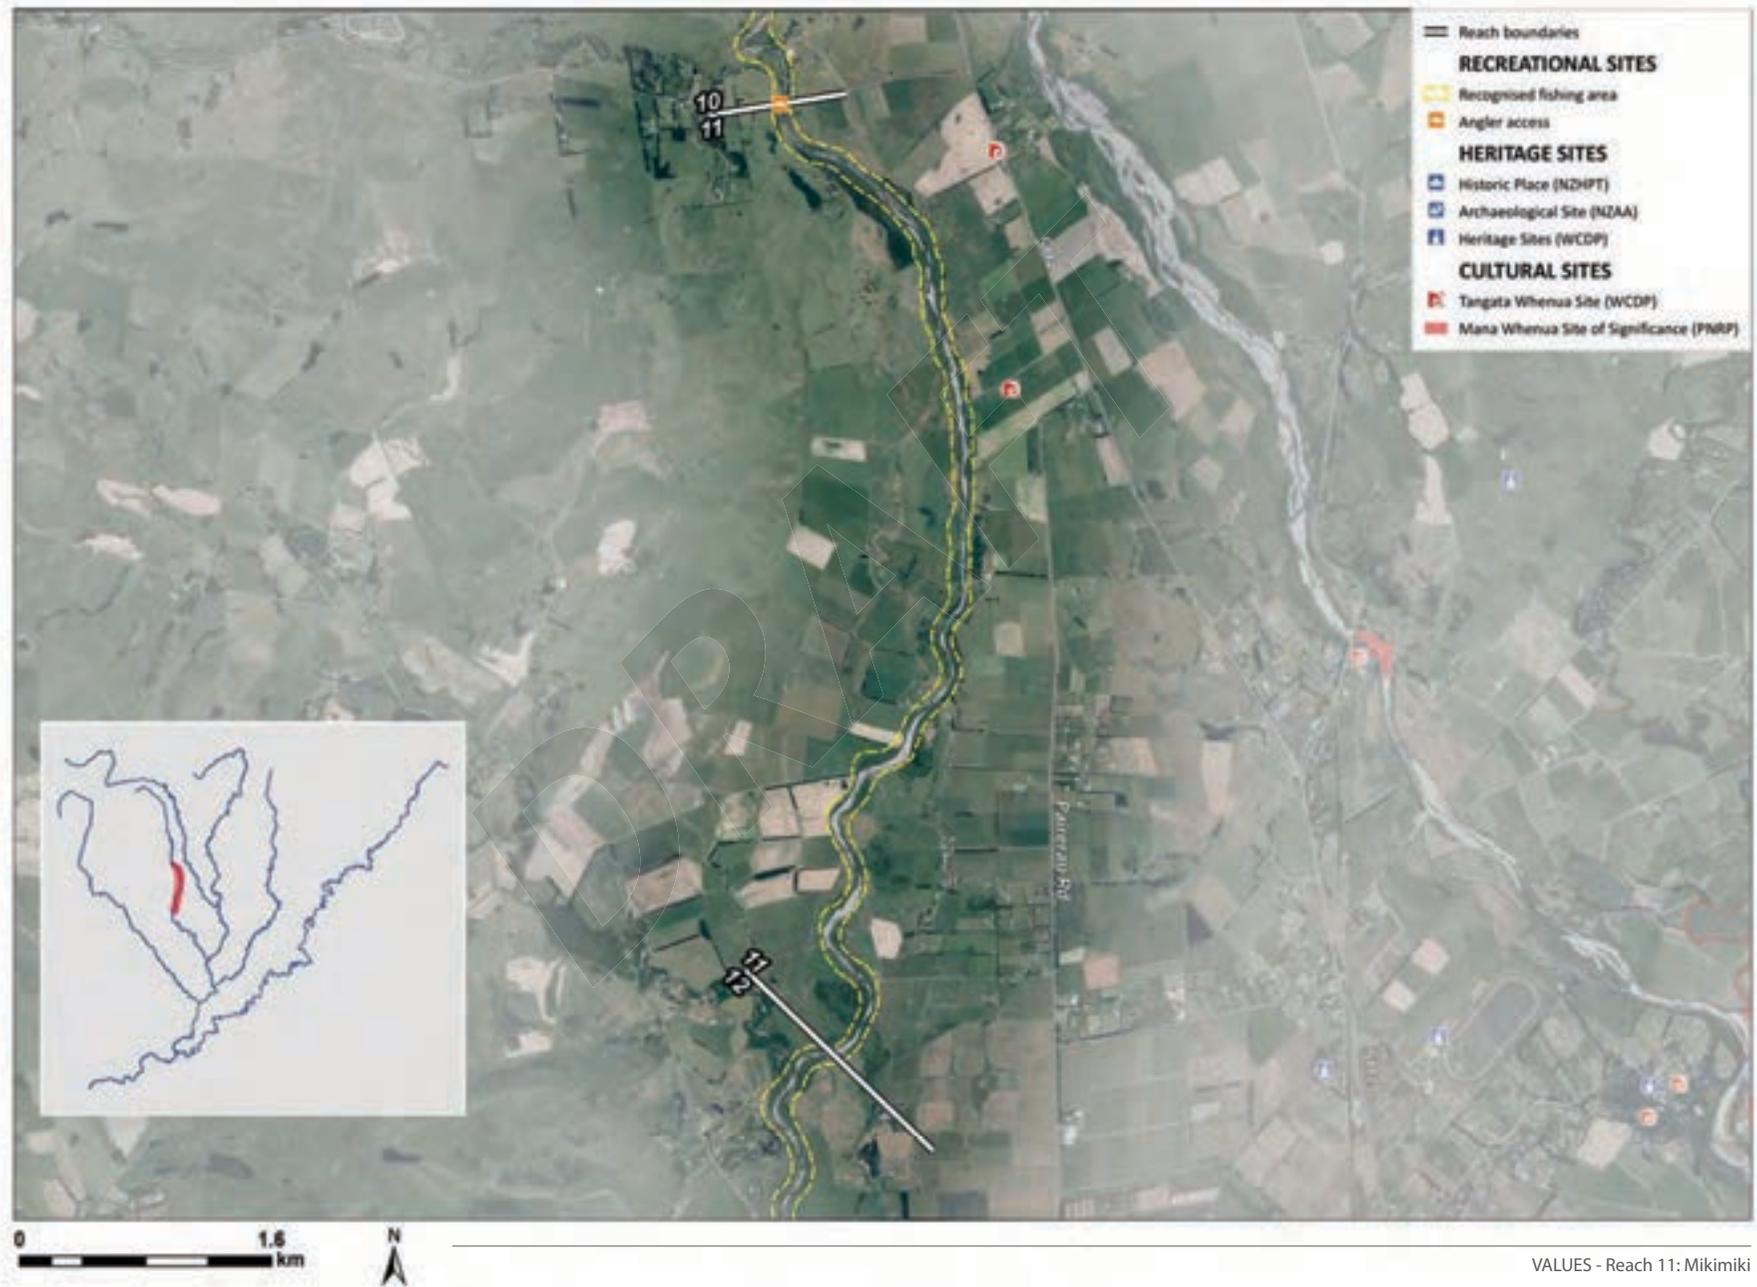

Terrestrial habitats with identified ecological value along this reach include areas of fenced indigenous forest, unfenced indigenous forest, mixed exotic-indigenous forest, indigenous treeland, stonefield, boulderfield, natural wetlands and ponds.

There are a limited number of specific cultural sites identified along this reach, which include an urupa.

Key Floodplain Management Points

- River maintenance activities will involve more works to maintain stopbank condition, river enhancement opportunities will be better explored and supported, and there will be a renewed focus on buffer implementation.
- Establishment of a better flow recorder and flood warning site.
- Work with the asset owner of Mikimiki Road Bridge to ensure its continued protection and operation.

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES
LANDSCAPE MODIFICATION	SCENIC VALUE					
Medium	Medium / High	Angler access, recognised fishing area	-	Urupa	Rural (Primary Production), Rural (Special), Road, River.	Fenced indigenous forest, Unfenced indigenous forest, Mixed exotic-indigenous forest, Indigenous treeland, Stonefield and boulderfield, Natural wetlands and ponds

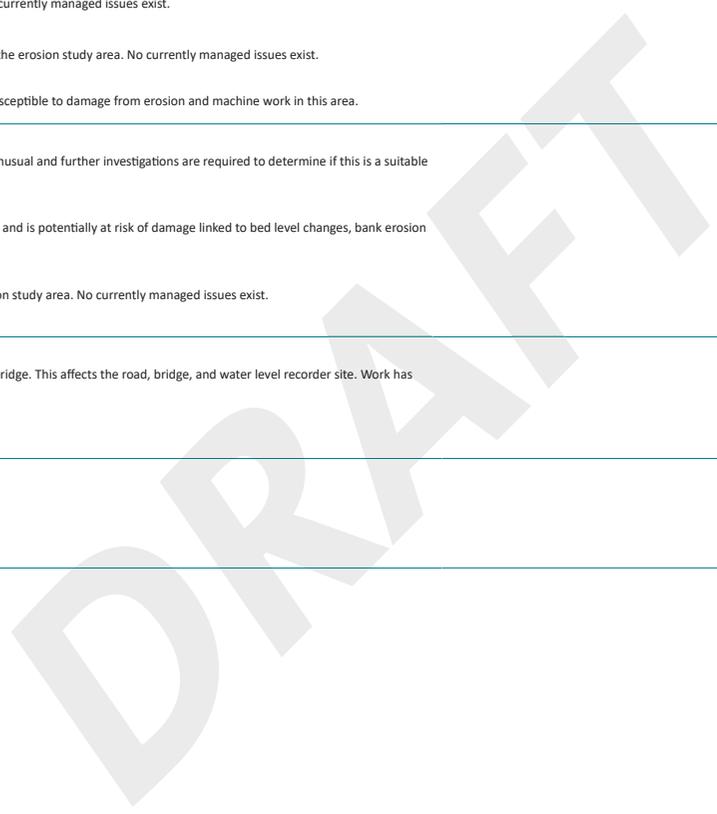

VALUES - Reach 11: Mikimiki

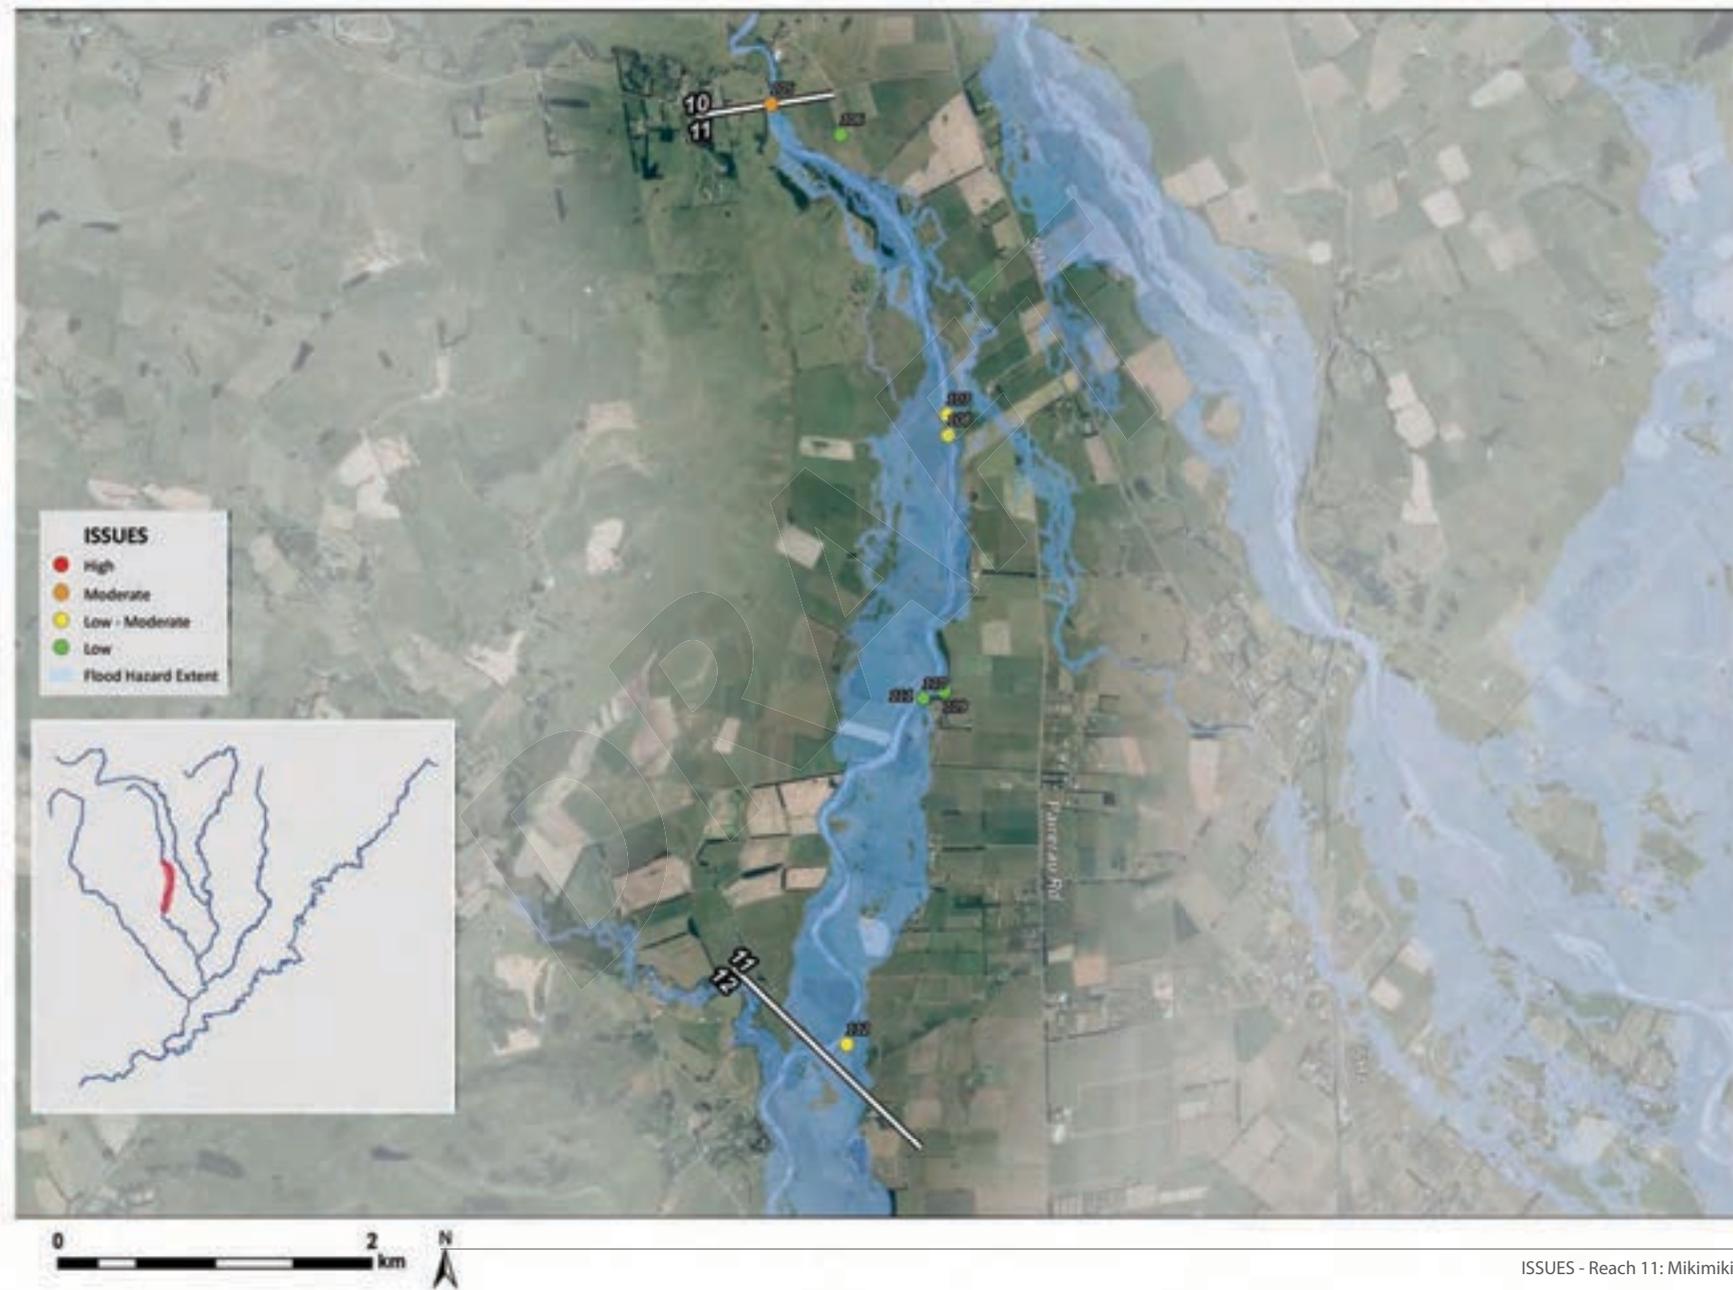

Mikimiki – Reach 11

Flood and erosion issues

A total of eight erosion and flood management issues are identified along this reach. Issues have been ranked according to their consequence and likelihood (i.e. risk) and assigned an ID number [xx].

LOW	<p>Farm building [106] A farm building sits within the modelled 1% AEP flood extent. No currently managed issues exist.</p> <p>Farm building [109] A farm outbuilding is located within the 1% AEP flood extent and the erosion study area. No currently managed issues exist.</p> <p>Private telecom line [111] A private telecom line runs under the river bed. It is potentially susceptible to damage from erosion and machine work in this area.</p>
LOW TO MODERATE	<p>Design channel alignment [107, 108] The design fairway narrows from a width of 85m to 45m. This is unusual and further investigations are required to determine if this is a suitable design channel width.</p> <p>Stock access / private bridge [110] A privately owned access bridge sits within the erosion study area and is potentially at risk of damage linked to bed level changes, bank erosion and large flood events.</p> <p>Private water intake [112] A private water intake for Watson Lake is located within the erosion study area. No currently managed issues exist.</p>
MODERATE	<p>Mikimiki Bridge [105] There is ongoing bed degradation occurring in the vicinity of the bridge. This affects the road, bridge, and water level recorder site. Work has been carried out periodically to tackle scour issues.</p>
HIGH	

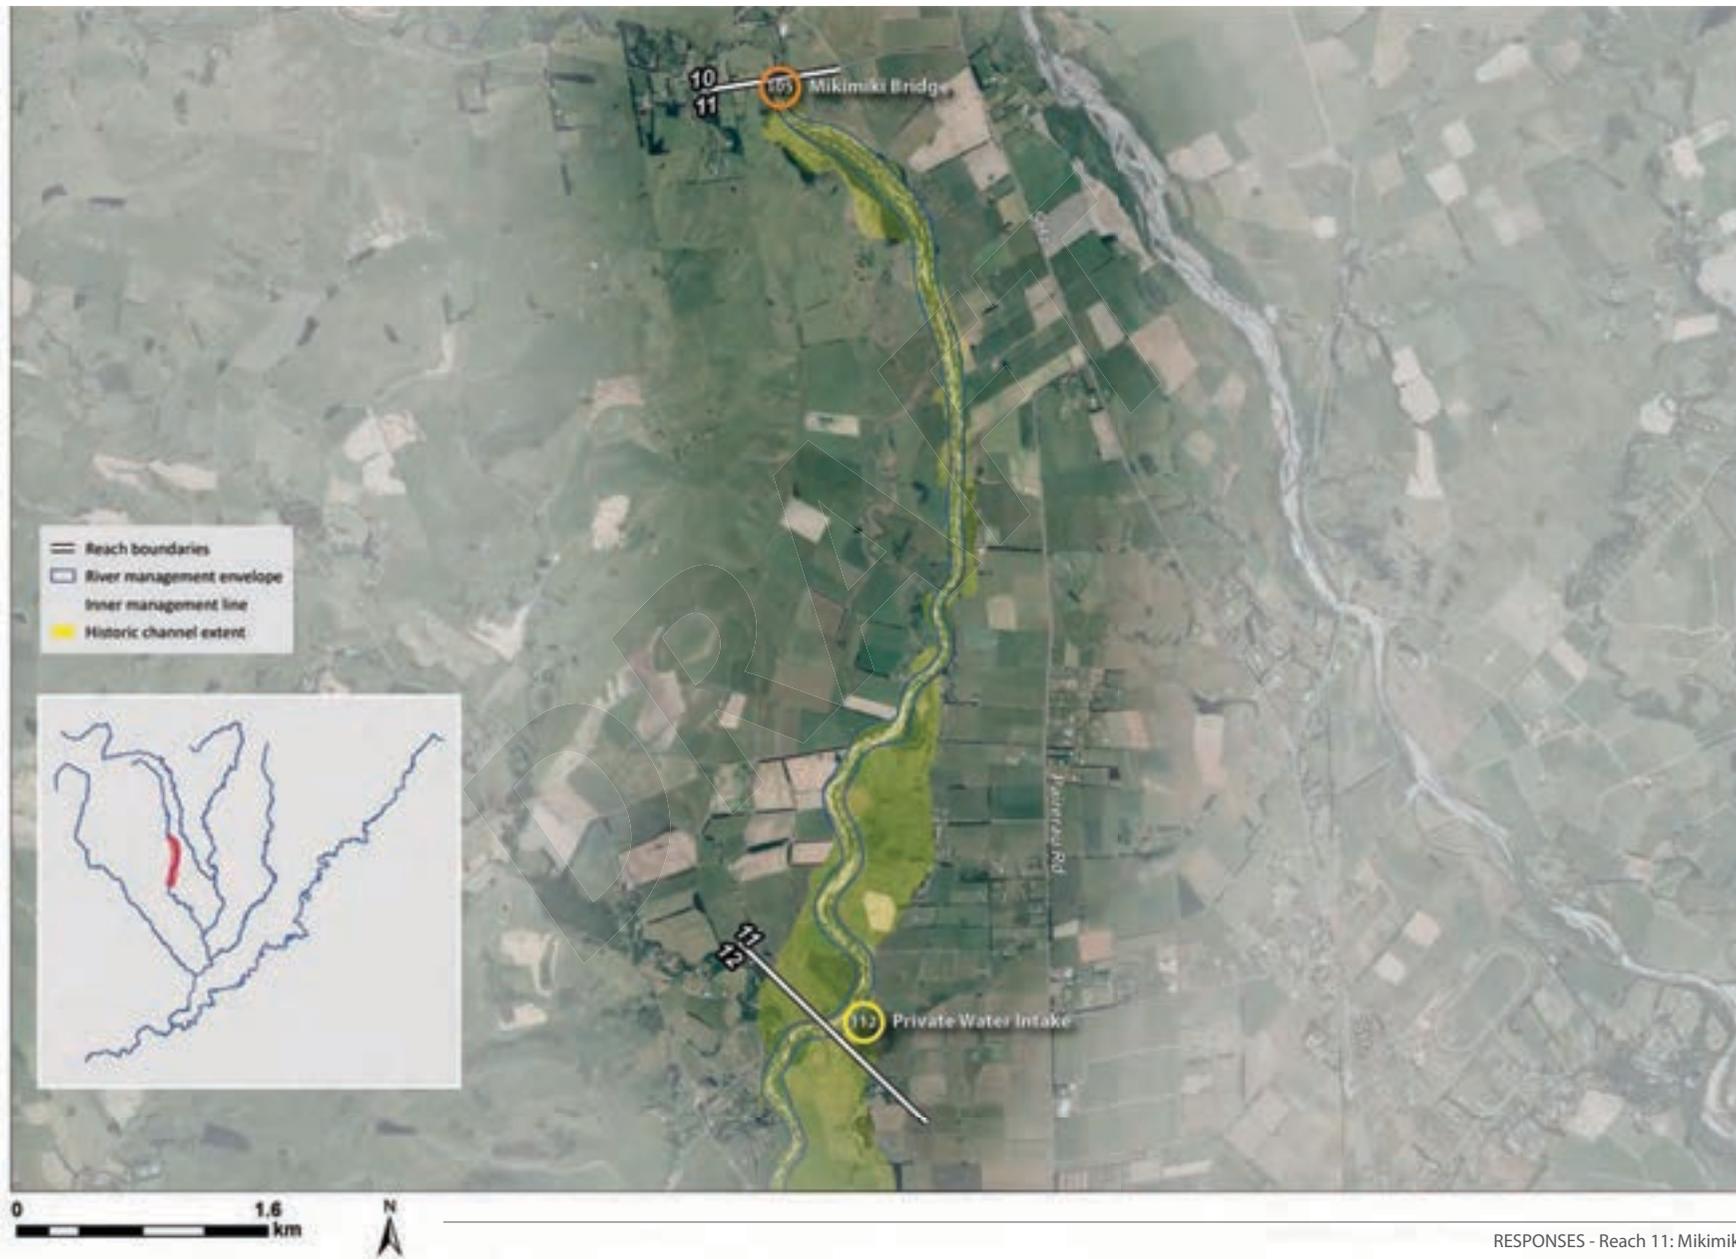

Mikimiki – Reach 11

Response

Common methods and specific responses that apply to this reach are set out below. The common methods used to address specific issues are listed in *Appendix 5*.

Reach Specific Responses

	ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES	LEVEL OF SERVICE (AEP)		RESPONSIBILITY		PRIORITY
					CURRENT	TARGET	PRIMARY	SECONDARY

North Masterton – Reach 12

Character

To the north of Masterton, the Waipoua River moves away from the toe of the Tararua Ranges and follows a meandering course across the Wairarapa Plains. The margins of the river reflect increasing rural lifestyle use with varied willow planting interspersed with poplar and shelterbelts. Bank modification also commences in the lower part of this reach.

Key characteristics

Meandering single channel

Increasing rural lifestyle settlement along margins

Range of willow, shelter belt, amenity planting and hard edges along margins.

Values

This reach flows through increasing rural residential settlement to the north of Masterton. Some beach re-contouring and rock groynes have been established along the edges of the river. Willow and gorse is frequent through this area, with scattered totara also accommodated through adjoining areas of farmland. This has resulted in a medium level of landscape modification overall with medium scenic values.

Good early season fishing continues along this reach of river, with access obtained from Paierau Road Bridge and by negotiation with private land owners. Mahunga Golf Course also occupies the true left bank along this reach.

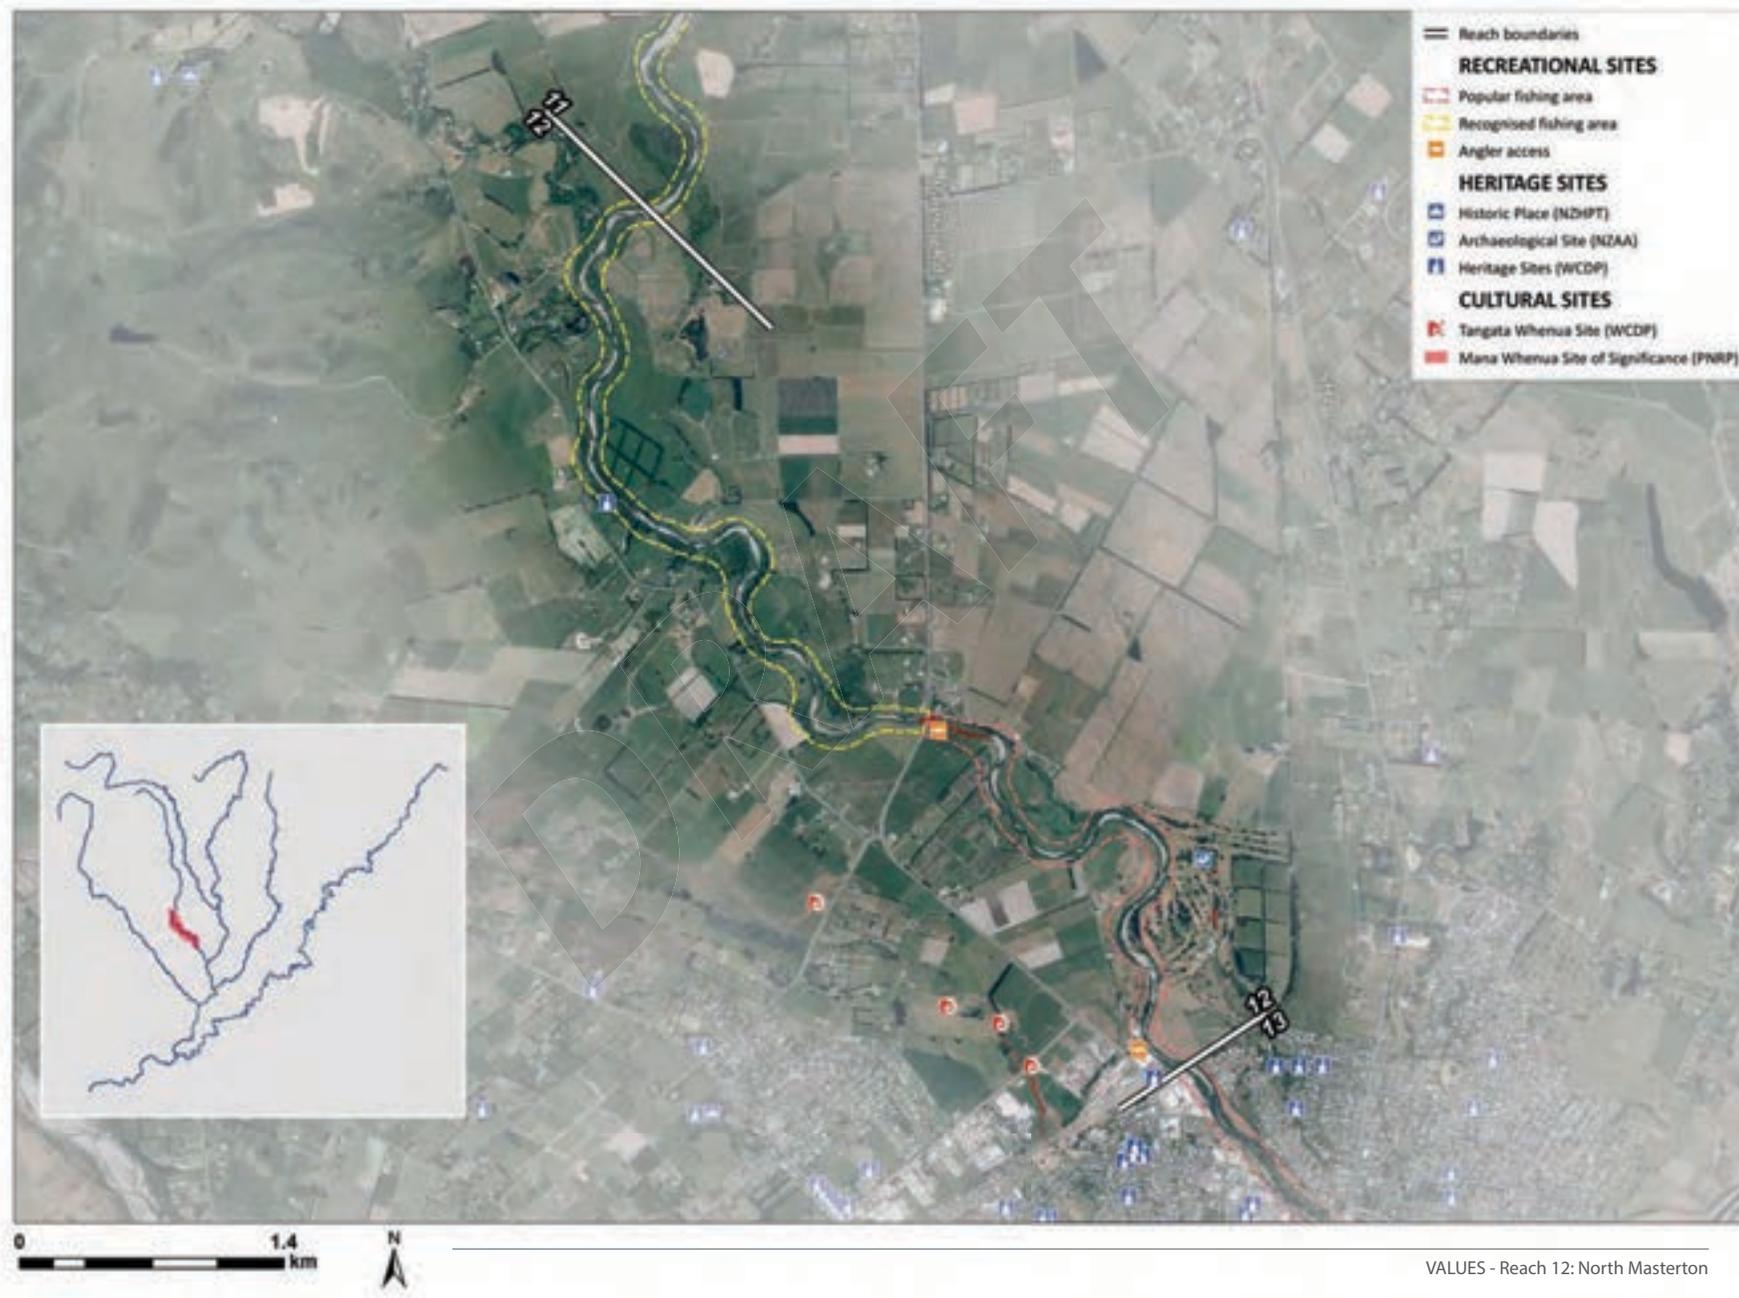

Terrestrial habitats with identified ecological values along this reach include areas of unfenced indigenous forest, mixed exotic-indigenous forest, indigenous treeland, stonefield and boulderfield and natural wetlands and ponds.

There are limited cultural sites identified along this reach encompassing historic pā sites. Levin's Woolstore and Matahiwi College are also identified heritage sites within the WCDP.

Key Floodplain Management Points

- River maintenance activities will involve more works to maintain stopbank condition, river enhancement opportunities will be better explored and supported, and there will be a renewed focus on buffer implementation.
- Raise the awareness of flood risks and improve the safety of Paierau Road and Matahiwi Road during large floods.
- Work with the community in the vicinity of Paierau Road and the Serpentine confluence to reduce their vulnerability to flooding.
- Work with the infrastructure owners of Paierau Road Bridge and the rail bridge to ensure their continued security and operation.

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES
LANDSCAPE MODIFICATION	SCENIC VALUE					
Medium	Medium	Angler access, popular and recognised fishing areas	Levin Woolstore, Matahiwi College (WCDP)	Historic pa sites, mahinga kai (PNRP)	Rural (Primary Production), Rural (Special), Road, River, Industrial, Railway, Flood Protection and Mitigation, Intersection Improvement.	Unfenced indigenous forest, Mixed exotic-indigenous forest, Indigenous treeland, Stonefield and boulderfield, Natural wetlands and ponds

VALUES - Reach 12: North Masterton

North Masterton – Reach 12

Flood and erosion issues

A total of 23 flood and erosion issues have been identified along this reach on account of its close proximity to Masterton. Issues have been ranked according to their consequence and likelihood (i.e. risk) and assigned an ID number [xx].

LOW	<p>Private rock line [114] A rock line has been constructed to protect a water intake, and private property. This is maintained infrequently by GWRC flood protection.</p> <p>Akura nursery [132] Akura nursery floods from overland flows originating upstream of the Paierau Road Bridge.</p>	
	<p>Channel alignment [113] The buffer strip downstream of the boundary between reach 11 (Mikimiki) and this reach has been identified as being too narrow. It is recommended that a wider buffer is established.</p> <p>Water intake [115] A private water intake for a lake is situated within the erosion study area. This intake has been protected by privately funded erosion protection works.</p> <p>Channel alignment [116] The buffer planting on the true right bank has been protected behind a private rock line. This has reduced vulnerability of this buffer area while the rock line is properly maintained.</p> <p>Matahiwi Road [117] A section of Matahiwi Road sits within the erosion study area and is modelled as affected by the 1% AEP flood up to a depth of 0.6m. No currently managed issues exist.</p> <p>Houses [118, 119, 120] Several houses are located within the erosion study area and are modelled as affected by the 1% AEP flood event. No currently managed issues exist.</p> <p>Stopbank proximity to river [121] The left bank stopbank sits on the edge of the active channel and within the erosion study area. There has been past consideration of relocation of the active channel away from this stopbank, and change of design fairways.</p> <p>Low quality stopbank [122] The stopbank is located very close to the river and at higher risk of erosion. It contains substantial tree growth making it vulnerable to storm damage and other failure mechanisms.</p> <p>Serpentine confluence [123] Aggradation at the mouth of the Serpentine Stream confluence with the Waipoua is increasing risk of flooding and blockages.</p> <p>Houses [125] A house is located within the erosion study area. No currently managed issues exist.</p>	<p>Houses [128] Houses on Matahiwi/Akura Road are at risk of flooding in a modelled 1% AEP flood event. No currently managed issues exist.</p> <p>Paierau Road Bridge [126] The Paierau Road bridge capacity is adding to upstream flooding extents due to its limited capacity to convey flood flows.</p> <p>Stopbank [130] The quality, standard, alignment and purpose of the combined flood protection works between the Serpentine confluence and the vicinity of the Paierau Road Bridge are not well defined.</p> <p>Stopbank [131] The alignment of the stopbank on the right bank of the river downstream of the Paierau Road Bridge gradually approaches the channel, and at its downstream end is located within the erosion study area.</p> <p>Stopbank [133] The stopbank on the left bank of the river is within the erosion study area and has in the past required erosion protection works to protect it from erosion issues.</p> <p>Houses [134] Houses are located within the modelled 1% AEP flood extent. No currently managed issues exist.</p> <p>Mahunga Golf Course [135] The golf course is located within the modelled 1% AEP flood extent and the erosion study area. Areas of the golf course have eroded in the past.</p> <p>Channel narrowing [136] The river channel becomes increasingly confined as it approaches the railway bridge upstream of Masterton. The channel at the Railway Bridge is highly constricted, which limits the amount of flow that can pass under the bridge and into the Masterton reach. This causes modelled upstream flooding of Mahunga Golf Course and properties on the western bank of the river and leads to a modelled eventual overtopping of the railway line near the station, north of Masterton.</p> <p>Channel alignment [137] No design fairways have been created for the section of the Waipoua which flows through Masterton. This creates management challenges due to a lack of guidance for river engineers</p>
LOW TO MODERATE		
MODERATE	<p>Serpentine stopbank [124] The Serpentine stopbank is of concern because while it partially protects a number of properties, the management objectives for the structure are unclear. It is also located very close to the river and within the erosion study area.</p> <p>Paierau Road [127] The stopbanks upstream of the Paierau Road Bridge overtop frequently, and the road subsequently floods. This is compounded by the northern approach to the Paierau Road Bridge which doesn't provide clear visibility of flood prone area to someone approaching at speed.</p> <p>Houses [129] Houses on the left bank are located within the erosion study area. No currently management issues exist.</p>	
HIGH		

ISSUES - Reach 12: North Masterton

RESPONSES - Reach 12: North Masterton

Major Project Response: Paierau Road

The issue

The southern approach to Paierau Road bridge is inundated to a depth of approximately 0.5m in a 20% AEP flood and up to 1.0m in a 1% AEP flood. Traffic approaching from the north has a maximum sight distance of approximately 100m, which is considered insufficient within a 100km/hr speed limit zone. Masterton District Council currently operates a road closure procedure but this has limited lead time as there is currently no rainfall based flood forecasting used for emergency notifications. It is proposed to provide permanent warning signs at this site as well as improved road closure warnings to ensure the road is closed before it is significantly inundated.

Opportunities

The response provides improved warning for drivers and will ensure the road is closed in a timely fashion to avoid the risk of a vehicle hitting the deep flowing water at high speed.

Relationship with common methods

The southern approach is inundated due to the low-level rural stopbanks overtopping upstream of Paierau Road (Issue ID 331). These stopbanks are considered to provide an adequate level of protection in line with the Rural Stopbanks Policy provided for in the common methods. It is noted that within this reach there are sections of stopbank within the buffers which could be retreated, particularly in response to a flood related failure. This is also referred to in the Stopbank Assessment Rating Priority Table – Stopbank ID 14 Serpentine to Paierau.

The capacity of the bridge is also noted as a factor that contributes to the frequency of the road flooding (Issue ID 75). It is not considered cost effective or consistent with the visions and aims to enlarge the channel and bridge and to increase the height of stopbanks in this reach to contain flood waters.

Description

General

Permanent warning signs “Road May Flood” to be added the northern and southern approaches and an improved warning system for road closures developed based on rainfall triggers.

Costs - \$20,000 (\$10,000 new signs, \$5,000 improved warning system + \$5,000 contingency)

Implications

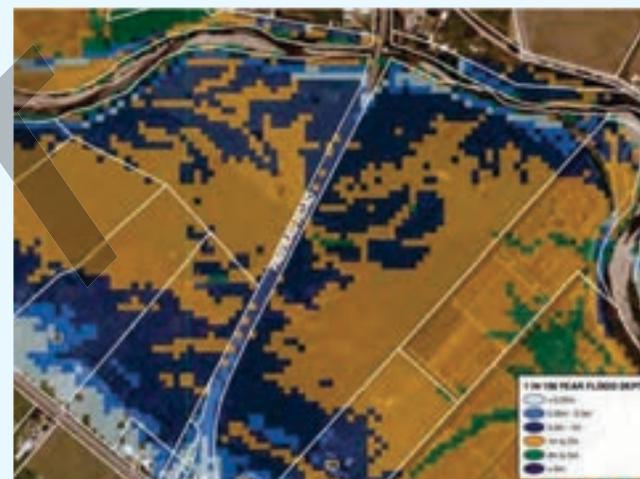

Traffic will be diverted when road is inundated resulting in longer travel times.

Priority

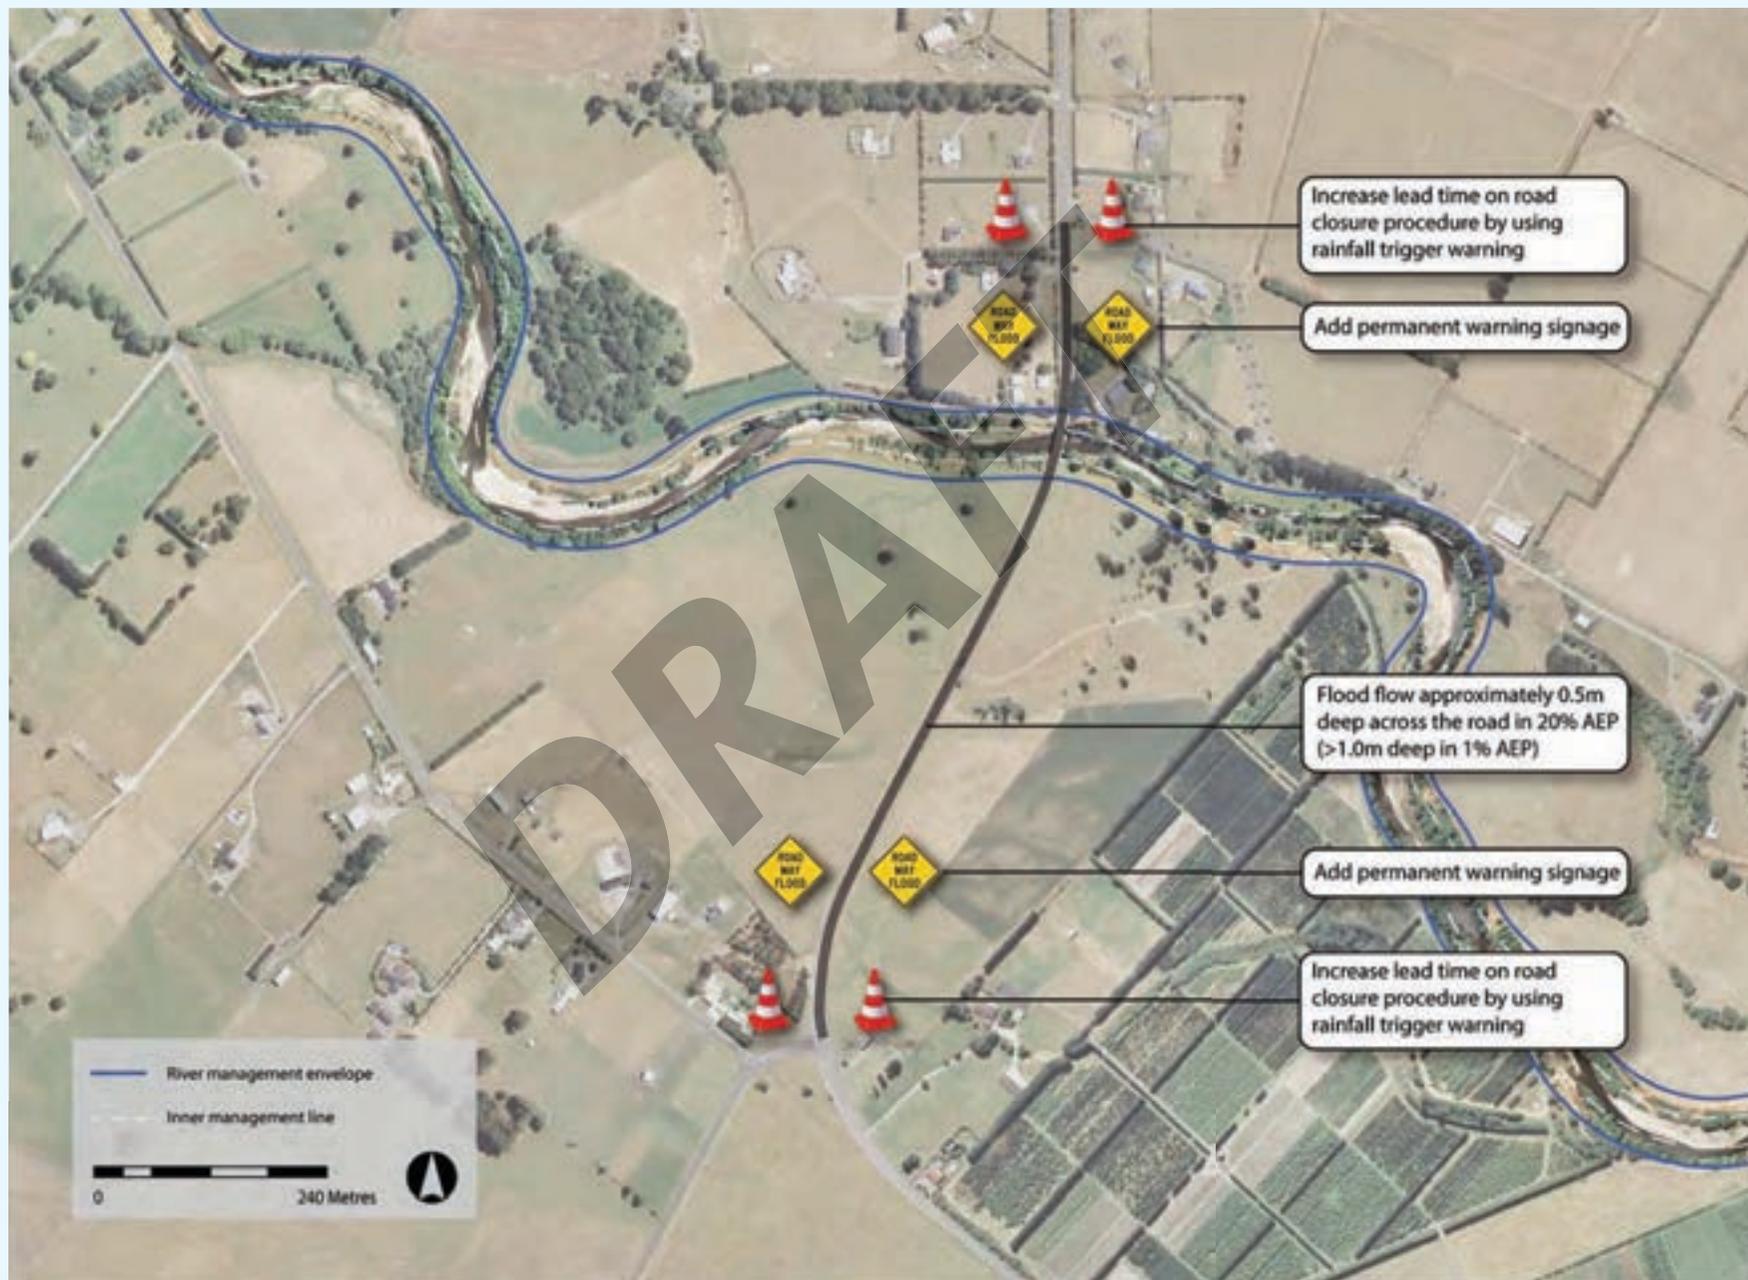

Medium

Level of Service

Currently a warning is provided to MDC Roding Engineer based on 20% AEP flood being exceeded at the Mikimiki flow recorder on the upper Waipoua River. This provides 90 minutes for contractors to mobilise and establish manned road closures at Loopline and Matahiwi Road. A rainfall based warning could potentially increase this warning time to 2.5 hours providing greater certainty of completing road closure before the road becomes inundated.

REFERENCE NUMBER	MANAGEMENT MEASURE	CURRENT LEVEL OF SERVICE	THREATS TO CURRENT LEVEL OF SERVICE	PROPOSED LEVEL OF SERVICE	PRIMARY REASON FOR RESPONSE	RESPONSIBILITY	PRIORITY	COST	FUNDING
127	Permanent warning signs and improved flood forecasting	90 min warning from Mikimiki	Risk of not responding in time.	Road closure completed prior to inundation in 20% AEP event	To increase the safety of road users by providing permanent warning signs and increasing lead time for road closure to 2.5 hours.	MDC/GWRC	Medium	\$20,000	Capital funding TBC

Urban Masterton - Reach 13

The following sections describe the character and values, current flood and erosion risks, current responses to flood and erosion risk (including existing river maintenance activities), and the key floodplain management aims and outcomes sought in relation to the Masterton urban reach - Reach 13. The proposed response to flood and erosion risk in the urban reach is set out in Section 5.

This information should be considered in conjunction with adjoining rural reaches within the Waipoua River as set out in Part 2, including North Masterton – Reach 12, given the inter-related nature of the flooding issues through this area, as well as Reach 5 of the Ruamāhanga River.

Character

The Masterton urban reach extends from where the railway line crosses the Waipoua River within north Masterton, to the confluence of the Waipoua River and the Ruamāhanga River to the south-east of Masterton.

The river bisects the majority of the township of Masterton, primarily on the southern bank, from Lansdowne on the northern bank. The river through this area has undergone substantial modification in the past through historic straightening and flood control works. It does, however, retain green space along its corridor formed by a number of parks and a scattering of vegetation.

Key Characteristics:

- Accessible green corridor including pedestrian pathways through urban area
- Mixed willow and amenity planting providing shading and enclosure

Prior to Masterton being founded it was the site of Maori settlement and many locations of cultural value exist on the floodplains and within the river. Important sites have been identified at the confluence and a number of pā, settlements and adjacent sites associated with community activities exist throughout and adjacent to this reach. The main pā was Kaikokirikiri Pā, which is located in the vicinity of Mahunga Golf Course, and its proximity to the Waipoua River indicates the significance of this area.

A number of heritage sites are also associated with European settlement in Masterton and include the building façade at 4 Queen Street and Queen Elizabeth Park which forms part of a wider heritage precinct to the south of Dixon Street.

Values

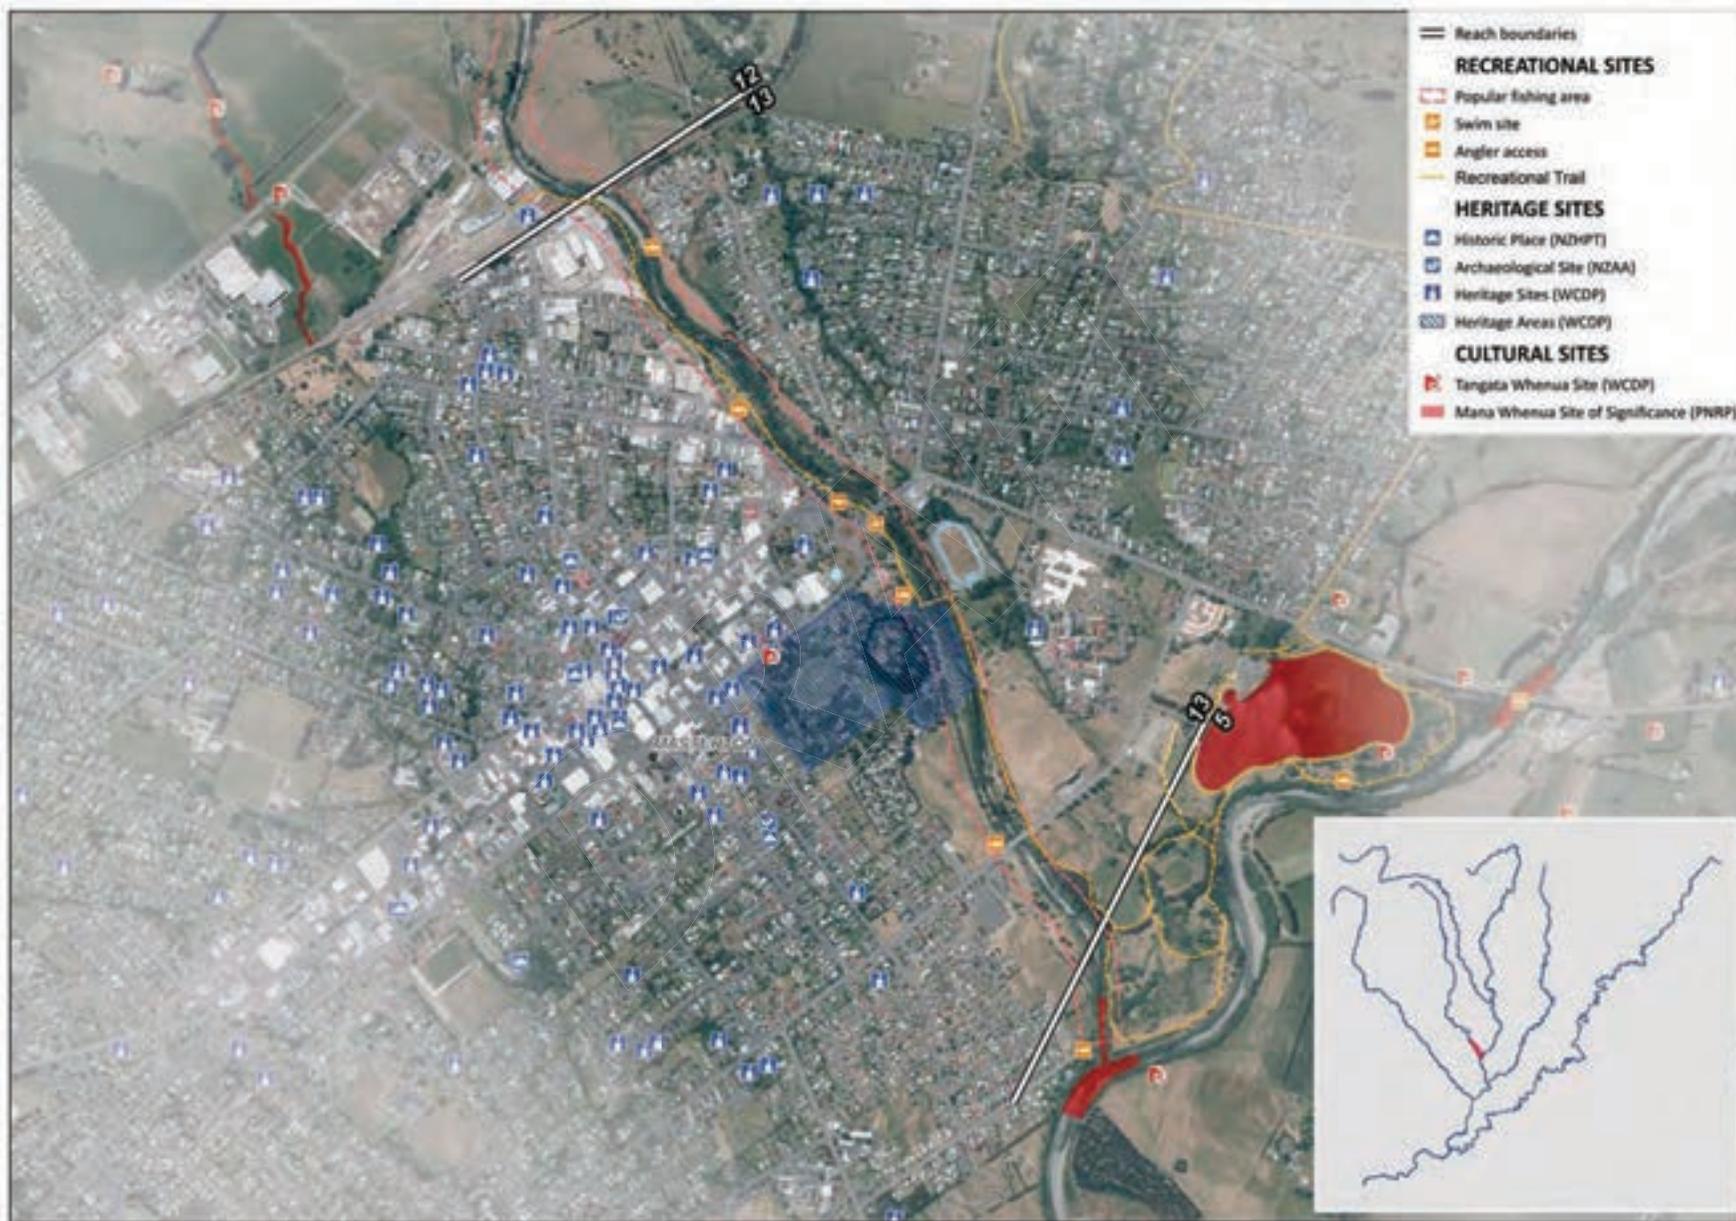

Due to its proximity to Masterton, this reach contains many values and associations with the adjoining community. Masterton itself is the largest urban settlement in the Wairarapa and home to more than 20,000 people.

Much of the river corridor has been modified, with stop banks incorporating stone pitching common throughout this area in association with bed control weirs and erosion protection structures around the rail and road bridges. Vegetation along this reach includes a mix of native and exotic vegetation typical of urban parks and forms a green band through the town which adjoins larger open space areas including Queen Elizabeth Park. Wetland areas have also been reinstated on the northern bank within Henley Lake Park.

Its proximity to Masterton also brings with it many recreational uses common to urban centres. It forms a linear park, and jogging, walking and dog walking, fishing, cycling and swimming are all carried out to varying degrees within the reach. Queen Elizabeth Park and Henley Lake Park are adjacent to this reach and are the location for a range of water based and land-based recreation activities. The reach also provides a corridor for fish passage to the northern reaches of the Waipoua River, with angling access providing popular fishing opportunities in several areas.

Whilst much of this reach has been modified, terrestrial habitat with identified ecological values which do occur in this area include mixed exotic-indigenous forest, indigenous treeland, stonefield and boulderfield and natural wetlands and ponds.

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES
LANDSCAPE MODIFICATION	SCENIC VALUE					
Medium / High	Medium	Angler access, popular fishing area, swimming, walking and cycling	Building Facade - 4 Queen Street, Queen Elizabeth Park (WCDF)	Historic house site	Rural (Special), Road, River, Residential, Industrial, Railway, Commercial, Flood Protection and Mitigation, Recreation, Cemetery, Electricity Distribution, State Highway	Mixed exotic-indigenous forest, Indigenous treeland, Stonefield and boulderfield, Natural wetlands and ponds

VALUES - Reach 13: Masterton

Key Floodplain Management Points

- Work with the community in the area of urban reach to reduce their vulnerability to flooding.
- Protect the Masterton community to 1% AEP flood including climate change level of service.
- Manage the residual flood risks to Masterton (the risk of a larger flood or failure of protection measures).
- Raise the awareness of flood risks.
- The infrastructure relied on by the Masterton community should be safe and efficiently protected from flooding impacts.
- Work with the infrastructure owners of SH2 and Colombo Road Bridges and the rail bridge to ensure their continued security and operation.
- The maintenance and improvement of recreation facilities along the Waipoua River adjacent to Masterton and encompassing Henley Lake and adjoining Wetland Park.
- Maintenance or improvement in the water quality within this reach, with particular regard for contact recreation.
- Maintenance or improvement to environmental value and habitat diversity.
- Work toward enhancing the identity of Masterton and its connection to the waterways in its vicinity.
- Explore opportunities to maintain or improve kayaking opportunities on the Waipoua River as the result of any structural upgrade works.
- Improvements in the opportunities for the Masterton community to engage with the river, including recreation trails for walking, cycling and nature play.
- Improved safety for recreation within this reach.

Flood and Erosion Issues

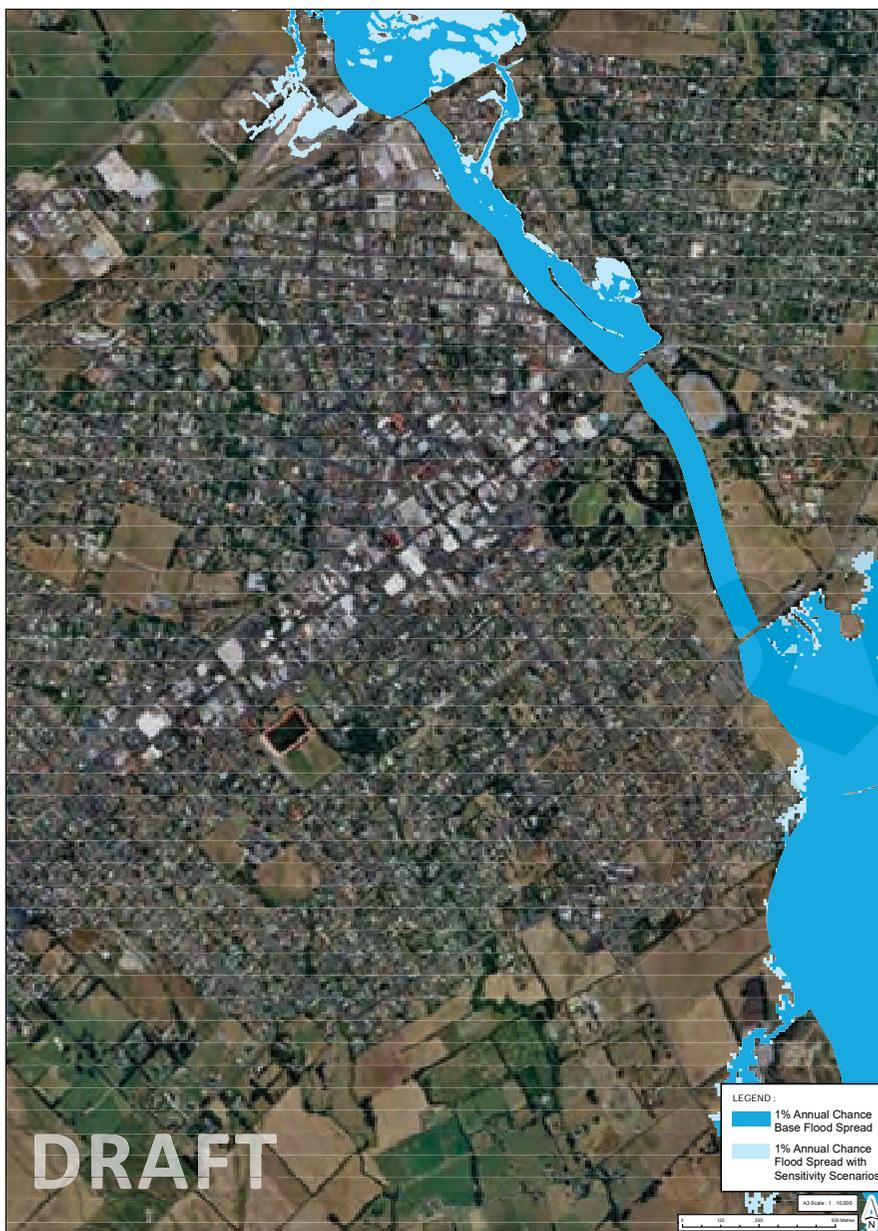

There are a number of key issues relating to flooding and erosion hazards within the urban reach of the Waipoua River through Masterton. One of the key issues is that the existing flood protection scheme of the Waipoua River, within the urban reach, has limited capacity and is likely to result in flooding to urban areas of Masterton during a 1% AEP event today or in the future. Further to this, the condition and integrity of the existing stopbanks within the urban reach are not well understood and may not be able to be relied upon to perform during flood events due to breach and seepage risks. A breach failure could occur in an event less frequent than a 1% AEP and result in more significant flooding depths with less warning time. As a result of the limited capacity in the river channel, floodwater is predicted to spill in urban areas along in a major event.

Flood hazard maps have been developed with GWRC and MDC which depict the modelled flood extents of the Waipoua River for the current and existing hazard, shown on Page 11. These maps are still draft, subject to an independent audit.

If a 1% flood event occurred today, computational modelling identifies that approximately 30 properties through the Masterton urban area are at risk from flooding during such an event. These properties are located in the Oxford Street area along the north-east (true left bank) of the river.

The level of flood hazard in the Masterton urban area is expected to increase into the future, as the effects of climate change lead to larger and more frequent flooding events. With the effects of climate change and sensitivity scenarios included in the computational modelling, the number of properties affected is significantly higher, with approximately 2,250 properties potentially affected. In the climate change scenario, properties at risk have been identified along both sides of the Waipoua River from a number of spill points, principally upstream from the railway bridge including through the railway underpass along Mahunga Drive, adjacent to the Fire Station and adjacent Mawley Park. Some of these locations are predicted to have flood water depths of greater than 1.0m. A significant portion of the Masterton town centre is also likely to experience flooding from overtopping the railway line to the east of the rail bridge, predominantly less than 0.3m and locally up to 0.5m.

Further downstream, flooding is also predicted to impact approximately 30 properties along River Road, at the confluence of the Waipoua and Ruamāhanga Rivers. Here the depths are predicted to be predominantly less than 0.4m.

Waipoua River: DRAFT Current 1% Annual Chance Flood Spread with Sensitivity Scenarios and Base Flood Spread

Waipoua River: DRAFT Future 1% Annual Chance Flood Depth with Sensitivity Scenarios

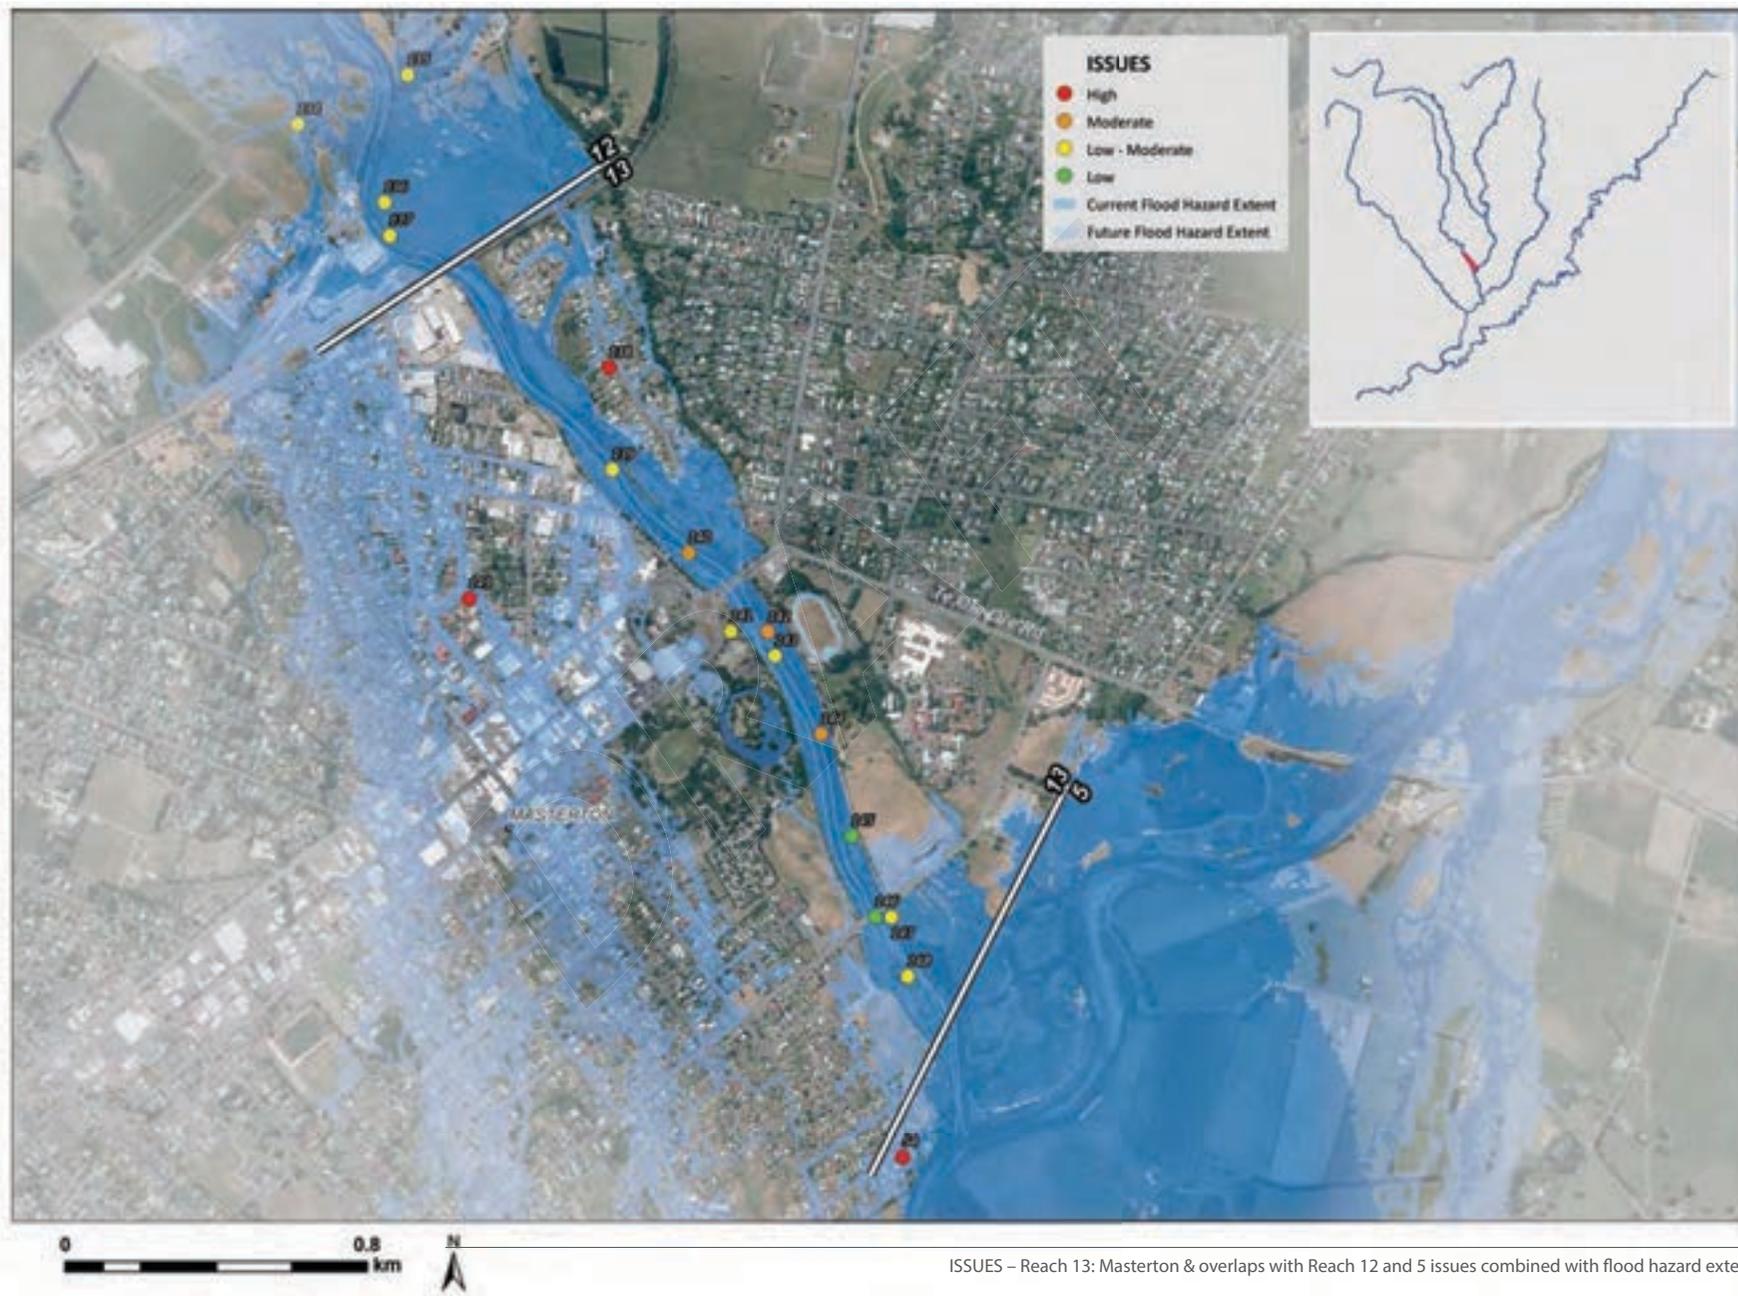

Urban Masterton – Reach 13

Flood and erosion issues

The flood and erosion issues (and management responses) for Reach 13 are closely linked to the issues (and responses) identified for the wider Waipoua and Ruamahanga catchments in Part 2 of the FMP. Some of the issues identified for North Masterton (Reach 12 of the Waipoua – [134,135,136 & 137]) and Te Ore Ore to Waingawa (Reach 5 of the Ruamahanga – [54]) are included in this section as they are particularly relevant to the Masterton urban reach. For completeness and to ensure integration, these are incorporated into the below issues (and the major project response) for the urban reach.

A total of 18 specific flood and erosion issues have been identified within Masterton’s urban reach and the adjoining areas of the Waipoua and Ruamahanga Rivers. Issues have been ranked according to their consequence and likelihood (i.e. risk) and assigned an ID number [xx].

RISK LEVEL	DESCRIPTION
LOW	<p>Lansdowne Sewer Siphon [146] The Lansdowne sewer siphon crosses the river adjacent to the Colombo Road Bridge. This structure is at risk of damage in high flow events, and it sits within the erosion study area.</p> <p>Irrigation Water Intake [145] The irrigation water intake for the rugby grounds on the northern bank of the Waipoua River is located within the erosion study area. Any changes in bed level would also potentially impact on the functionality of this intake.</p>
LOW TO MODERATE	<p>Houses [134] Houses are located within the modelled 1% AEP flood extent. No currently managed issues exist.</p> <p>Mahunga Golf Course [135] The golf course is located within the modelled 1% AEP flood extent and the erosion study area. Areas of the golf course have eroded in the past.</p> <p>Design Channel Alignment [137, 148, 143] The design channel alignments for the Waipoua River stop before reaching Colombo Road Bridge. This leaves approximately 800m length of river which flows through Masterton without a defined river corridor and management fairway, used as the current management technique for the rivers. This creates management challenges due to a lack of guidance for river engineers.</p> <p>Sewer lines [141] On both banks of the Waipoua, main sewer lines run underground between the stopbanks and the river channel. Their location puts them within the erosion study extents of the Waipoua River and would need to be considered during any significant update to the stopbanks.</p> <p>Emergency Sewer Discharge point [147] There is an emergency sewer discharge point located downstream of the Colombo Road bridge. This structure sits within the erosion study area.</p> <p>Stopbank issues [139] The current Masterton stopbanks are located in relatively close proximity to the main channel of the Waipoua River. This location puts them within the erosion study area which was derived from both modelled and historic erosion extents. The stopbanks have a number of known low spots that may have occurred through localised settlement, however there are a number of other points where the stopbanks have been deliberately lowered to improve access for mowing or maintenance of parks and reserves. The geotechnical condition of the stopbanks has been assessed as poor with further investigation required to better determine to structural integrity of the stopbanks.</p> <p>Channel narrowing [136] The river channel becomes more confined as it approaches the railway bridge upstream of Masterton. The channel at the Railway Bridge is highly constricted, which limits the amount of flow that can pass under the bridge and into the Masterton reach. This causes modelled upstream flooding of Mahunga Golf Course [Issue 135] and properties on the western bank of the river and leads to a modelled eventual overtopping of the railway line near the station, north of Masterton.</p>
MODERATE	<p>Bed control weirs [140, 142, 144] There are a number of bed level control weirs along the length of the Waipoua within the Masterton reach. These weirs retain the bed level through this straightened section of the river and counter the degradation process which would otherwise occur. The weirs themselves are at risk of damage during high flow events, and failure of them would lead to a decrease in river bed level and undermining of the banks which also has potential to threaten the stopbanks. Current maintenance responsibility for the weirs is not well defined. Historically additional weirs had been created during summer months to create swimming holes, however this practice has dwindled, although their existence is remembered fondly by many Masterton residents.</p>
HIGH	<p>Flooding in Oxford Street [138] – Current 1% AEP flood hazard In the current scenario (not including an allowance for climate change), some properties on the northern bank of the Waipoua along Oxford Street are subject to modelled flooding to depths considered to be significant hazard to life. This flooding occurs in both the modelled current and future 1% AEP flood events. There are approximately 30 properties which potentially fall into this category in this area. The flood waters through this location are of low velocity, and this is not a contributing factor to the hazard. The floodwater enters this area both by overtopping the stopbank adjacent to the Waipoua River and secondly by flowing through the Mahunga Drive underpass.</p> <p>Flooding in Masterton [149] – Future 1% AEP flood hazard, including an allowance for climate change and modelling uncertainties Flooding is modelled through Masterton in both a 1%AEP including an allowance for the effects of climate change and uncertainties in the modelling. This modelled flood spread affects approximately 2,250 properties. For the majority of these affected properties the flood depth is relatively shallow (i.e. less than 0.3m). The floodwaters first overtop the stopbanks at a known low spot near the fire station and flow in a southerly direction back towards the Ruamahanga River. A second overflow route occurs when the floodwaters trapped upstream of the railway bridge overtop the railway line near the train station and flow in a southerly direction towards the Ruamahanga River. The flood spreads are confined by a slight rise in the ground level that runs in a north/south direction through town. The depth and velocity of this floodwater does not contribute a high hazard to life for an able-bodied adult for most of this area. Flooding at the confluence of the Waipoua and Ruamahanga Rivers, at River Road, is also modelled in an extreme event.</p> <p>River Road Properties [54] 14 River Road properties sit within the erosion study area. This erosion affect was observed in the 1998 floods where parts of some of these property sections started to erode into the river. This erosion is currently managed by a series of heavy rock groyne; however, this requires ongoing maintenance and management. Note that there are River Road also properties at risk of flooding during a future flood event, as noted in Issue 149.</p>

ISSUES – Reach 13: Masterton & overlaps with Reach 12 and 5 issues combined with flood hazard extent

Urban Masterton – Reach 13

Response

Common methods and specific responses that apply to the Masterton urban reach (Reach 13), including related parts of Reach 12 (North Masterton), are set out below. The relevant common methods used to address specific issues are listed in *Appendix 5*.

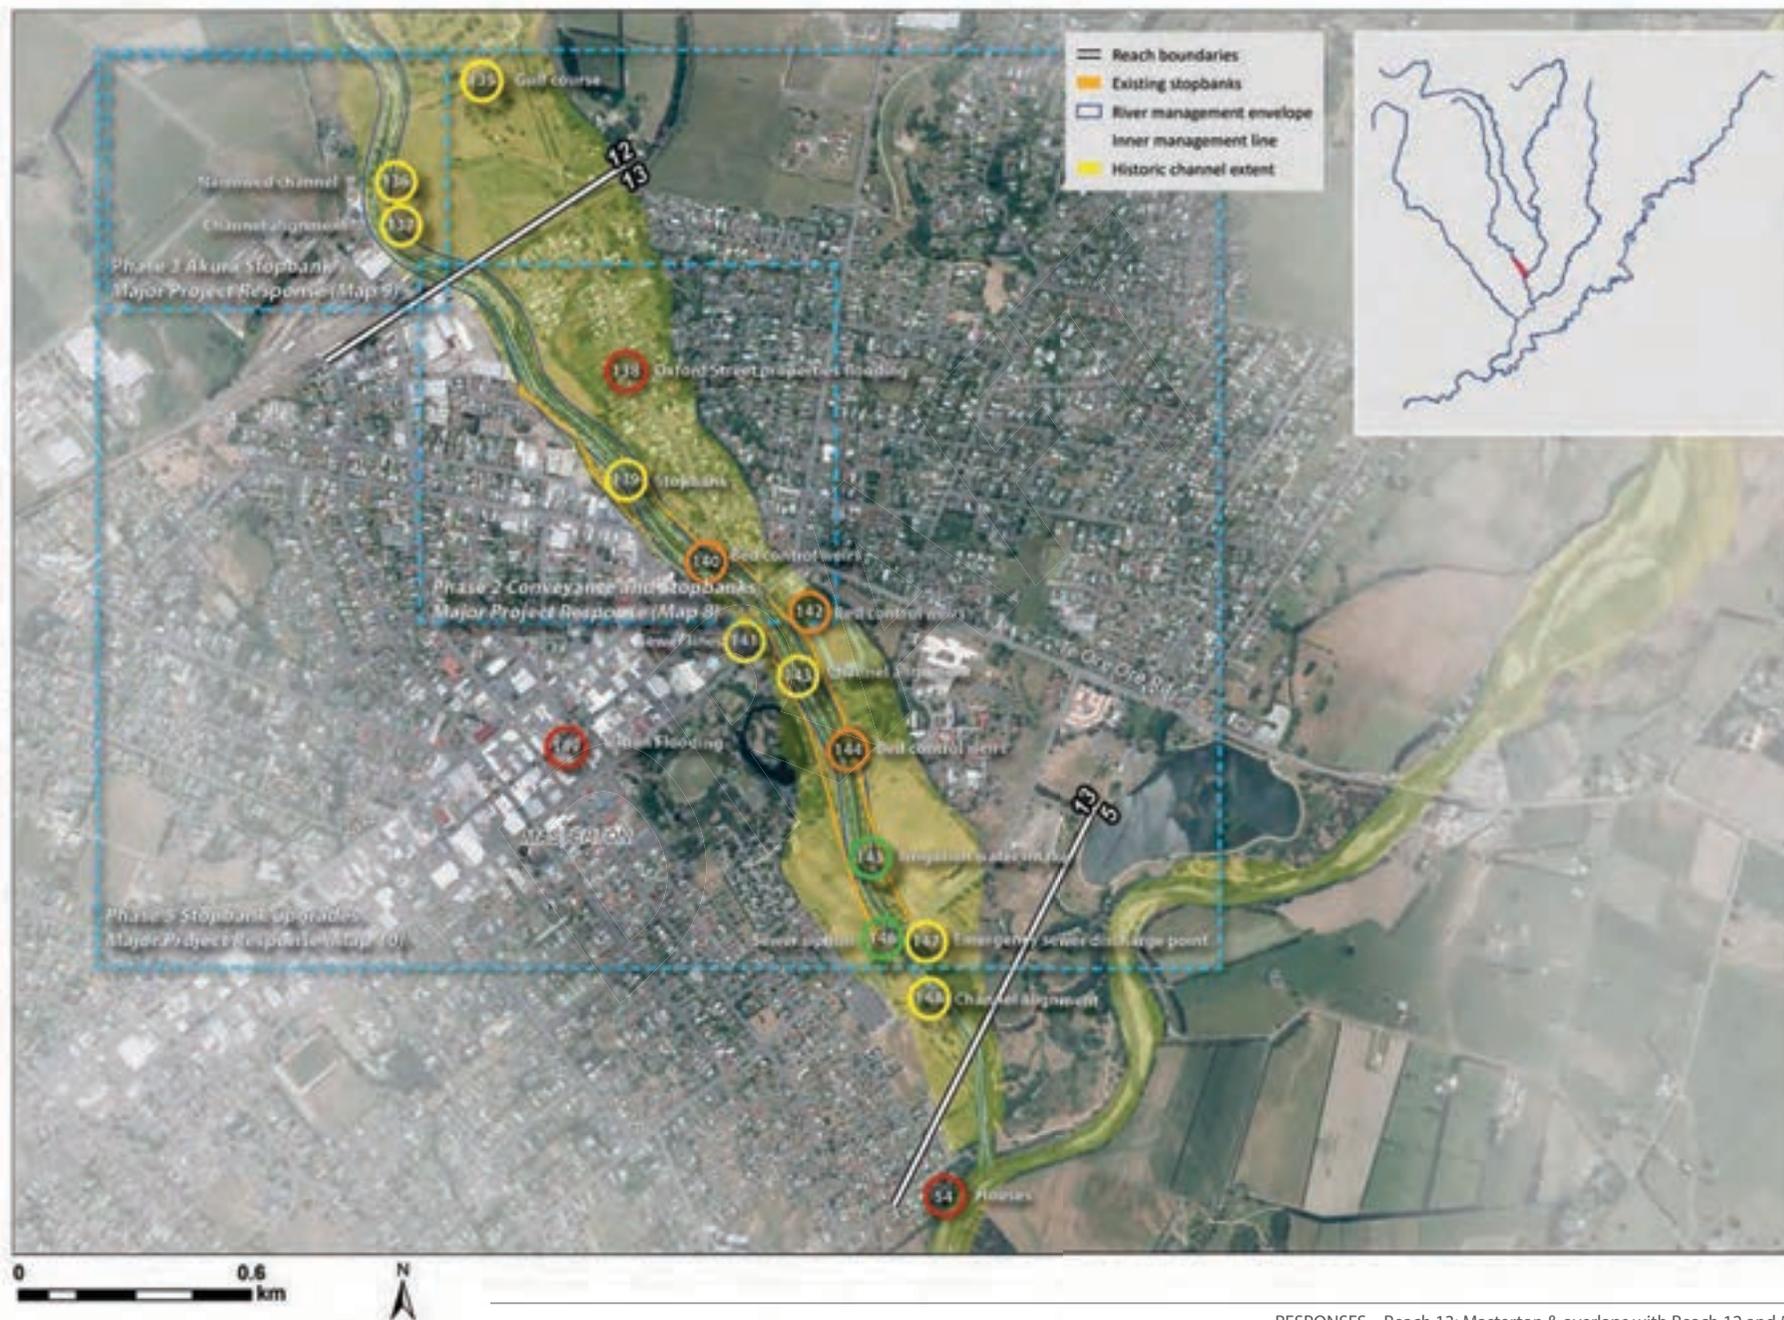

The response that has been developed to address the identified flood and erosion issues affecting Masterton is best described as a comprehensive Major Project Response. The response is to be phased over five stages in order to address

the identified flood and erosion issues in an efficient, effective and affordable way, and to respond to future climate change issues.

Note: The identified erosion issues associated with properties along River Road [54] are addressed by the ‘River Road’ major project response (detailed on page 78) and have been considered in developing responses through Masterton’s urban reach.

Reach Specific Responses

	ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES	LEVEL OF SERVICE (AEP)		RESPONSIBILITY		PRIORITY
					CURRENT	TARGET	PRIMARY	SECONDARY	
	146	Lansdowne Sewer Siphon	River management	Provide continued advice and support to MDC with regard to operation of the sewer siphon infrastructure. Continue to provide erosion protection to the siphon.			MDC	GWRC	Low
	145	Irrigation Water Intake	River management	River management envelopes will contribute to security of private water takes. Private water takes will have low risk of damage up to a 20% AEP event. Damage to structures is more likely up to a 5% AEP event. Communicate risk to landowner		20%	Landowner	GWRC	Low
	134	Houses	Planning and policy	Inform landowners of potential risk.			Landowner	GWRC	Low to moderate
	141	Sewer Lines	River Management	Work with MDC to improve security of the Masterton sewer lines and consider implications during any significant update to the stopbanks			MDC	GWRC	Low to moderate
	147	Emergency Sewer Discharge point	River Management	Provide continued advice and support to MDC with regard to operation of the emergency sewer discharge point and infrastructure. Continue to provide erosion protection to the emergency sewer discharge point.			MDC	GWRC	Low to moderate
SPECIFIC RESPONSES	137 148 143	Design Channel Alignment	River Management	Design lines to be extended to the confluence of the Ruamāhanga River. Apply bed level monitoring and river management envelope common methods to manage channel alignment.			GWRC		Low to moderate
	135	Mahunga Golf Course	Planning and policy	Inform landowner of potential risk			Landowner	GWRC	Low
	136	Channel narrowing	River Management	Apply bed level monitoring and river management envelope common methods to monitor channel width. This issue is also addressed in the major project response in section 5			GWRC		Low to moderate
	139	Stopbank issues	Structural	Provide continued advice and support to MDC with regard to the need for additional stopbanks and upgrades to existing stopbanks This issue is addressed in the major project response in section 5	1% AEP	1% AEP + CC improvements	GWRC		Low to moderate
	140 142 144	Bed Control Weirs	River Management	Apply bed level monitoring and river management envelope common methods to identify any maintenance required			GWRC		Moderate
	138	Flooding in Oxford Street	Structural	Provide information to property owners regarding potential erosion and flood risk. Provide advice and support. Add Oxford Street to WREMO register of lifelines affected by large scale flood events. This issue is addressed in the major project response in section 5			MDC	GWRC	High
	149	Flooding in Masterton	Structural	Provide continued advice and support to MDC with regard to the need for additional stopbanks and upgrades to existing stopbanks. This issue is also addressed in the major project response in section 5			MDC	GWRC	Low to moderate
	54	River Road Properties	River Management	Provide information to property owners regarding potential erosion and flood risk. Provide advice and support. This issue is also addressed in the major project responses for Reach 5 of the Ruamāhanga.			MDC	GWRC	Moderate

RESPONSES – Reach 13: Masterton & overlaps with Reach 12 and 5

ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES	LEVEL OF SERVICE (AEP)	RESPONSIBILITY	PRIORITY
COMMON METHODS	Entire reach	River management	Code of Practice, river management envelope (design lines), river bed level monitoring, gravel extraction and analysis, riparian planting of buffers, mixed riparian planting with buffers, pest management in riparian planted buffers, pool-riffle-run envelope, historic channel lines, isolated works support, alternative land uses within planted buffers			
	Entire reach	Planning and policy	Land use controls, designations, flood hazard maps, rural stopbank policy, scheme funding decision making policy, abandonment/retirement of assets, river management access, strategic land purchase			
	Entire reach	Emergency management	Emergency management planning, community resilience, flood forecasting and warning system			
	Entire reach	Environmental enhancement	Environmental Strategy, Community Support Officer, Riparian Management Officer, care group and clubs			

Stopbank Summary

ISSUE ID	NAME	CURRENT PURPOSE	LENGTH OF STOPBANK (M)	LENGTH INSIDE BUFFER ZONE (M)	CONDITION RATING (2016) (GOOD1/2/3/4/5 POOR)	CRITICALITY	BENEFITING WHOM? (PRIVATE INDIVIDUAL, PRIVATE MULTIPLE, PUBLIC, OTHER)	LEVEL OF PROTECTION (AEP)	OTHER ISSUES	FMP DIRECTION	FMP PRIORITY
	Oxford St	Protects residential properties up to ~2% AEP and Mawley Park from a 10% AEP flood	425	220	Ranges 2 - 4	High	Masterton – Residential/ Recreational	10-2%	Nil	Rebuild and extend within the next 5-10 years up to 1%AEP height. 	Queen Elizabeth Park	Protects community recreational facilities from flooding up to < 1% AEP	930	250	Ranges 2 - 3	High	Masterton - Residential/ Recreational	2-1%	Vegetation/ trees in stopbank	Rebuild and extend within the next 5-10 years up to 1%AEP height. Raise height in the future to allow to effects of climate change	High
	Colin Pugh Sports Bowl	Protects urban Masterton from flooding up to < 1% AEP	930	0	Ranges 2 - 4	Med	Community recreational assets	1%	Vegetation/ trees in stopbank	Rebuild and increase height in the future to allow for the effects of climate change	Low

Major Project Response: Urban Waipoua

The issue

This response will provide protection to Masterton from a 1% AEP flood event and has the potential to be adapted in the future to include the effects of climate change. The staged approach that is outlined will allow the understanding of the current and future risks to be refined, as well as enable communication and engagement with the community to raise awareness of the flood hazard and to better prepare those who could be affected by flooding hazards.

Future land use changes have the potential to reduce the risk in flood prone areas and could be designed to future-proof the river corridor and surrounding area. Making changes within the catchment, for example, planting, the introduction of wetlands and increasing the floodplain, may also help improve flooding issues.

The construction of new structural elements will offer more confidence in the performance of the flood risk management scheme. Where practicable, these elements utilise the natural geomorphological features of the river to increase the level of flood protection to people, property and infrastructure, while enhancing the spaces within the river corridor to align with community aspirations and allowing the river to move naturally.

The opportunity to increase the capacity of the Waipoua River, within the urban reach, will lower expected flood levels and reduce pressure on the stopbanks. These works enable the opportunity for the river corridor to be landscaped into community inspired areas which provide increased amenity and recreation values and promote connectivity between the town and the river.

Integration of the Urban Reach with the Wider FMP

The urban reach of the Waipoua River (Reach 13) cannot be considered in isolation from the upper reaches of the Waipoua River (particularly Reach 12, North Masterton) or the confluence with the Ruamāhanga River.

Investigations have shown that inundation of the floodplain upstream of the urban area reduces the flood flows through Masterton and reduces risk of spills over the stopbanks. Conversely, flooding from Reach 12 (North Masterton) flows overland to the urban area and increases the flood risk.

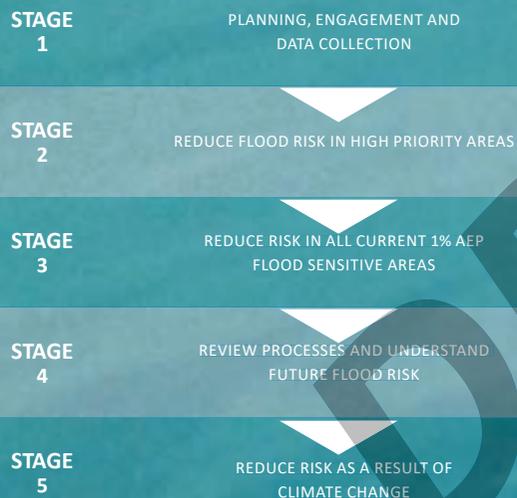

Downstream, at the confluence of the two rivers, the Ruamāhanga River level impacts the downstream end of the Waipoua River and contributes to flooding of River Road properties in extreme events.

The development of suitable floodplain management options therefore includes understanding the impact of anticipated changes across the wider Te Kāuru catchment including changes which will occur as a result of common methods and major project responses as set out in Parts 1 and 2 of the FMP.

The following responses in other reaches have specific potential to influence how responses are implemented within Masterton's urban reach:

- 1 Any work done upstream of the urban reach, in Reaches 9 to 12 of the Waipoua River, to attenuate the flood flows. This includes installation of managed wetlands, small on-farm storage, and the slowing down of the overland flow through bunds or increased vegetation.
- 2 Any work done in the upper catchment for erosion management measures, such as bank protection, that may change the characteristics of the river and the flooding.
- 3 Any development undertaken upstream, not only within the predicted flood extent area, but any large development within the catchment that would increase surface water runoff and change the catchment characteristics significantly. This includes controlling industrial and residential development or ensuring development does not allow excess stormwater to reach the Waipoua River at a greater rate than current.
- 4 Any changes to, or removal of, the flow control weirs through the urban reach. Initial sensitivity analysis shows there will be no change in flood risk as a result of removal of the weirs in large flood events, but more frequent events and low flows might alter the risk.
- 5 Implementation of a flood warning system for Paierau Road (Reach 12). Understanding how the flood warning process will be implemented at Paierau Road relates to any flood warning that could be used for the urban reach. The road floods in lower return period events and therefore may not be directly related to flooding from spills from the urban reach, however the information is likely to be useful and particularly relevant to the properties at risk of flooding from the overland flow from the upstream reaches.
- 6 The impacts of realigning the Ruamāhanga River and installing rock groynes immediately downstream of the confluence with the Waipoua River (Reach 5 of the Ruamāhanga River) as a major project response to mitigate the erosion risk at River Road (refer Part 2 of the FMP). This location is also at risk of flooding and changes to this reach of the Ruamāhanga River may alter the risk and flooding mechanisms at this location.

These considerations have the potential to impact the timing of the initiation of any structural options, interventions, and affect the scale of works required in the Masterton urban reach. These responses should all therefore be monitored as part of the long-term solution in the FMP.

Relationship with Common Methods

Making room for the river within the urban reach is consistent with other floodplain management responses throughout the Te Kāuru FMP. The planting and vegetation regime within the urban reach will need to be carefully managed to ensure the conveyance capacity between upgraded stopbanks is not compromised, and is in line with the values and aims of the FMP and community that recognise the river as an integrated part of the town.

Staged Approach

A staged approach is outlined for the urban reach of the Waipoua River. At the end of each stage an assessment will be made of whether to proceed to the next stage and what the scope of that stage will be.

The staging of flood management responses developed for the urban reach of the Waipoua River includes a combination of non-structural measures, improved river channel capacity, and upgraded stopbanks. This works in tandem with ongoing data collection and review to raise awareness and inform the detailed design of necessary structural responses.

A staged approach enables non-structural improvements to be implemented in conjunction with other management approaches. Some aspects can also be implemented in the interim while the detailed design of any structural approaches is being developed, or in the interim of a staged project. This ensures a pragmatic response to the current and future flood risk is developed.

There is also uncertainty with managing future flood risk. A staged approach remains adaptable as new information is obtained, and the effectiveness of initial stages is reviewed. As further understanding becomes available, responses can be adapted as complementary solutions to manage any residual risk or risk over and above protection afforded under the agreed level of service.

The staging of responses is set out to the left.

Each of the five stages and their component parts is described in more detail following.

Stage 1: Investigations and Option Consideration

The purpose of Stage 1 is to investigate the condition of existing assets (such as stopbanks) and further understand the risk of flooding in the urban reach. Following this, various designs for Stages 2 and 3 will be considered, in conjunction with the local community, to ensure a sustainable and affordable outcome. This stage is expected to take up to two years.

To achieve this, the following actions will be undertaken:

- Complete geotechnical investigations and gather further information:**
A better understanding of the condition and structural integrity of existing stopbanks is required before detailed designs can be completed. This can be gained through geotechnical investigations. These investigations will also be used to assess the soil and geology of the surrounding river environment to determine if it can be utilised to construct new stopbanks or for up-grades to the existing ones. Other information will also need to be gathered, such as building floor levels of properties in the flood zone and better flow records to build on existing data.
- Develop the design of preferred options in conjunction with the community:**
Once a more detailed understanding of the existing stopbanks and the surrounding environment is gained, specific options for managing the risk can be developed. Options regarding the specific locations of stopbanks, the levels of service any new stopbanks will provide, timings, costs, and design will all need to be considered through this development. This work shall consider opportunities to improve recreation, environmental and cultural values in tandem with the environmental strategy. The community will be consulted with throughout the process.
- Community preparedness:**
Work with the community to ensure they are resilient to both the current and future flood risk. This will involve raising awareness of the current and future flood risk through education, as well as promoting community preparedness and the development of emergency response plans.
- Land use change, land purchase and other regulatory processes**
Land use within the upper catchment will be considered during this stage. In particular, this covers the encouragement of wetlands in the upper reaches of the Waipoua River for environmental benefits and to help attenuate a flood peak.
While land purchase is not currently expected, it may need to be reviewed through Stage 1 to ensure that the agreed level of service is provided to those in the flood zone.
Planning restrictions will also need to be considered to ensure that the development within the river corridor and predicted flood sensitive areas are regulated, particularly in regard to building floor levels.

Stage 2: Reduce Flood Risk in High Priority Areas

The second stage of the project response addresses the high priority flood risk issues from the 1% AEP flood event, and specifically the flooding in Oxford Street. This will be achieved through increasing the channel capacity by lowering the river berms and upgrades to the stopbank system throughout the urban reach and upstream in Reach 12.

1. Design and construct 1% AEP flood risk management improvements:

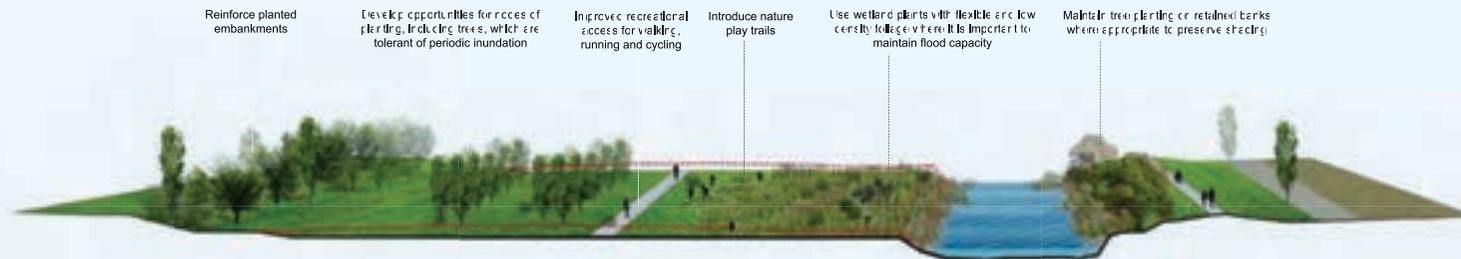

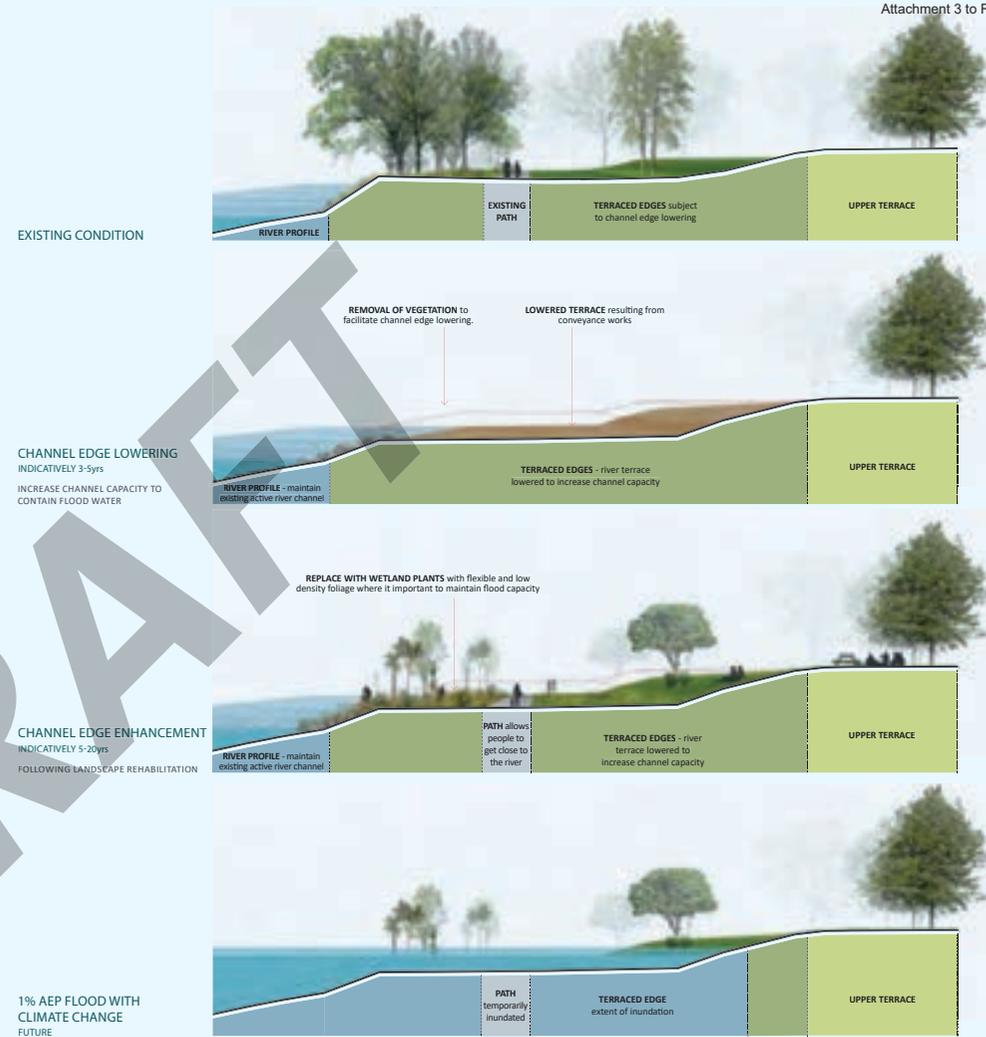

- a Complete the full design phases, covering implementation of the increased channel capacity and upgrades to the stopbank system (within the urban reach and related upstream areas in Reach 12).
- b Develop a channel capacity and stopbank improvement concept which incorporates the values and aims of the Te Kāuru FMP and the Masterton town centre, as well as delivering community aspirations for the river corridor.
- c Include provision within the designed flood risk protection scheme for improvements to be added in the future to allow for the predicted effects of climate change.
- d Increase capacity improvement concepts by lowering the existing river terraces on both banks of the Waipoua River and incorporating stopbank upgrades (as shown on page 21). Concepts should be sensitive to the significant visual impact expected during construction. This work will improve the capacity of the flood channel and reduce the peak water level of the key design flood events.

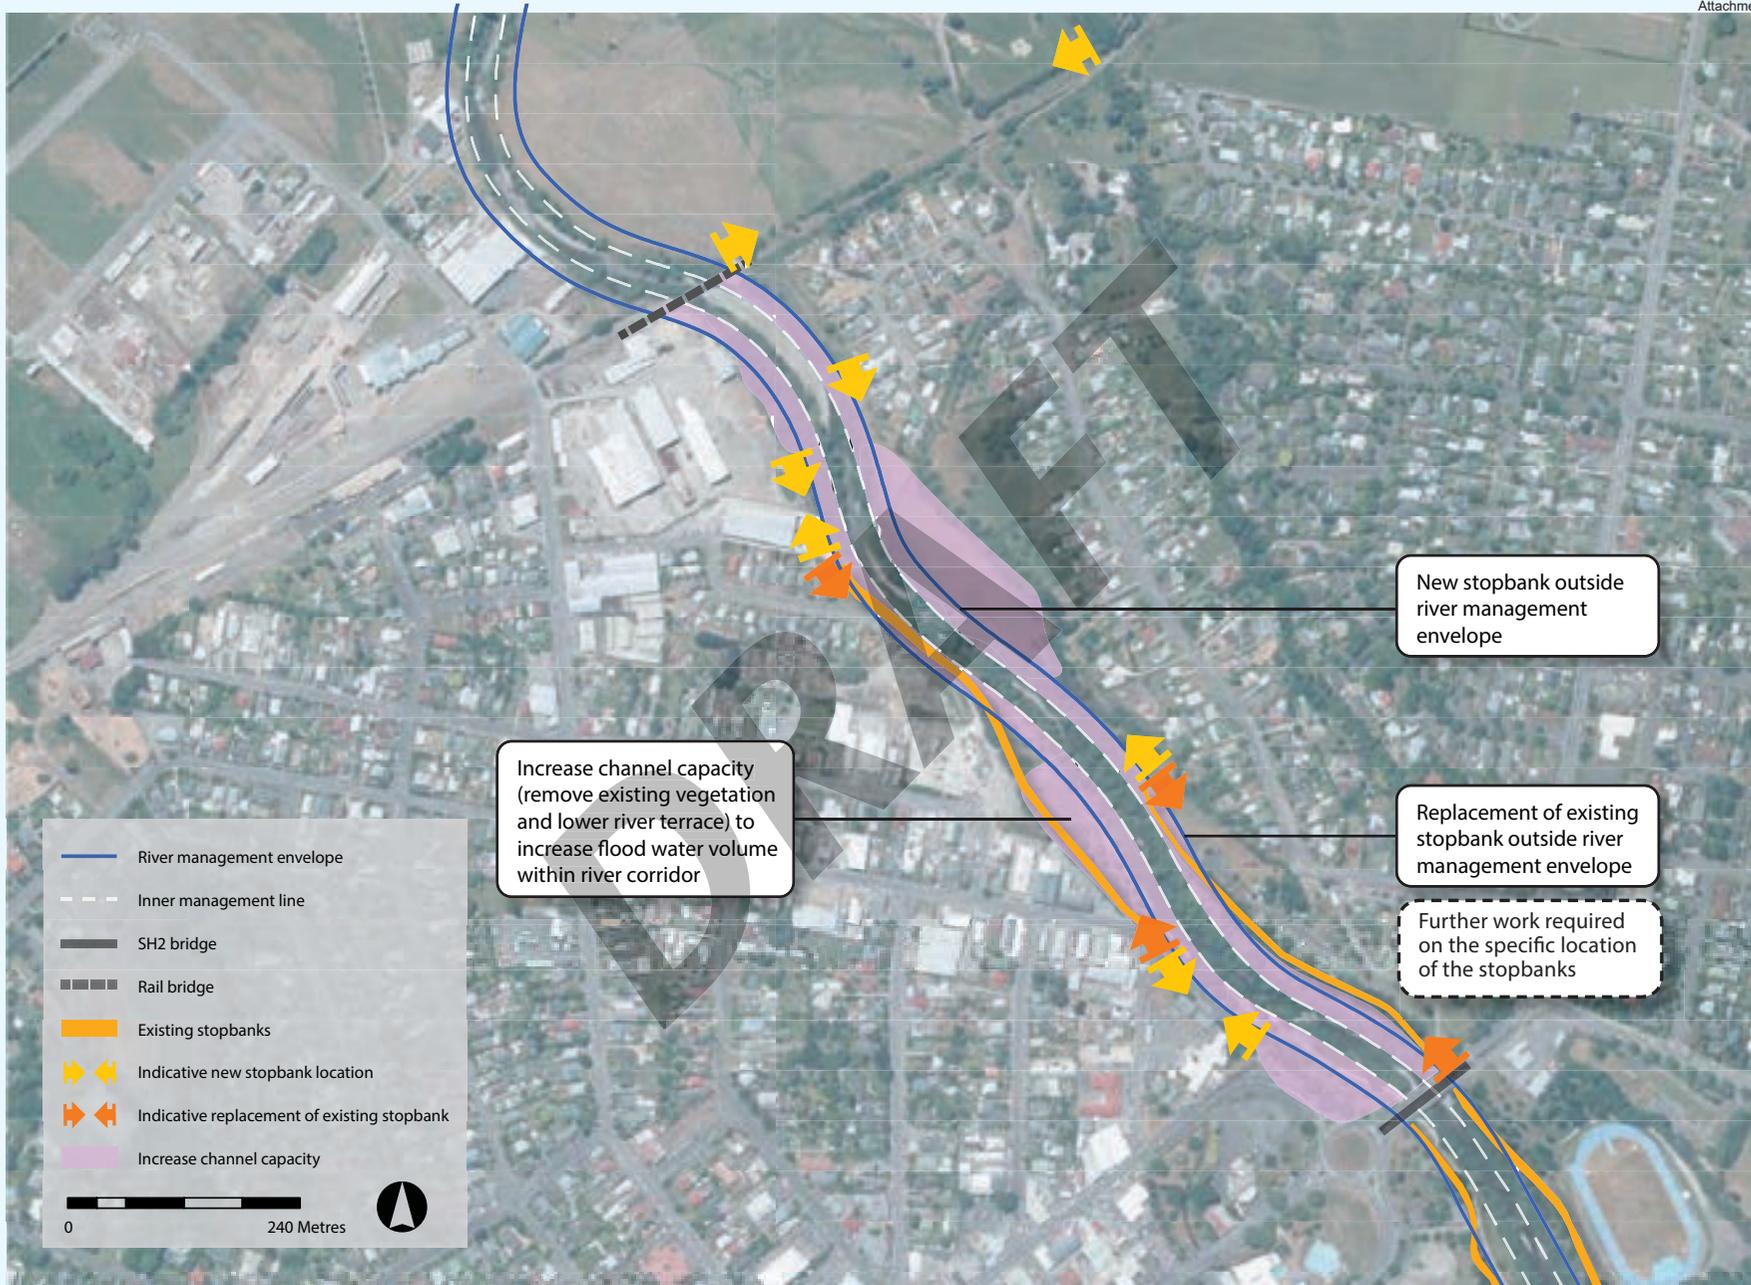

2. Develop and implement asset management plan:

- a Develop or update asset management plans to ensure continued performance of flood risk management assets throughout the intended design life and incorporate maintenance and management of the stormwater network.

The majority of existing vegetation will need to be removed to lower the river channel edge to achieve greater channel capacity. This will result in significant disruption in the medium term, until new recreation and environmental opportunities are established. This will include improved spaces for walking, running, cycling and other leisure activities.

Stage 2 is expected to be implemented in approximately 2-5 years' time.

Response Stage 2 - Increase channel capacity with new and replaced stopbanks

Stage 3: Reduce Risk in Current 1% AEP Flood Sensitive Areas

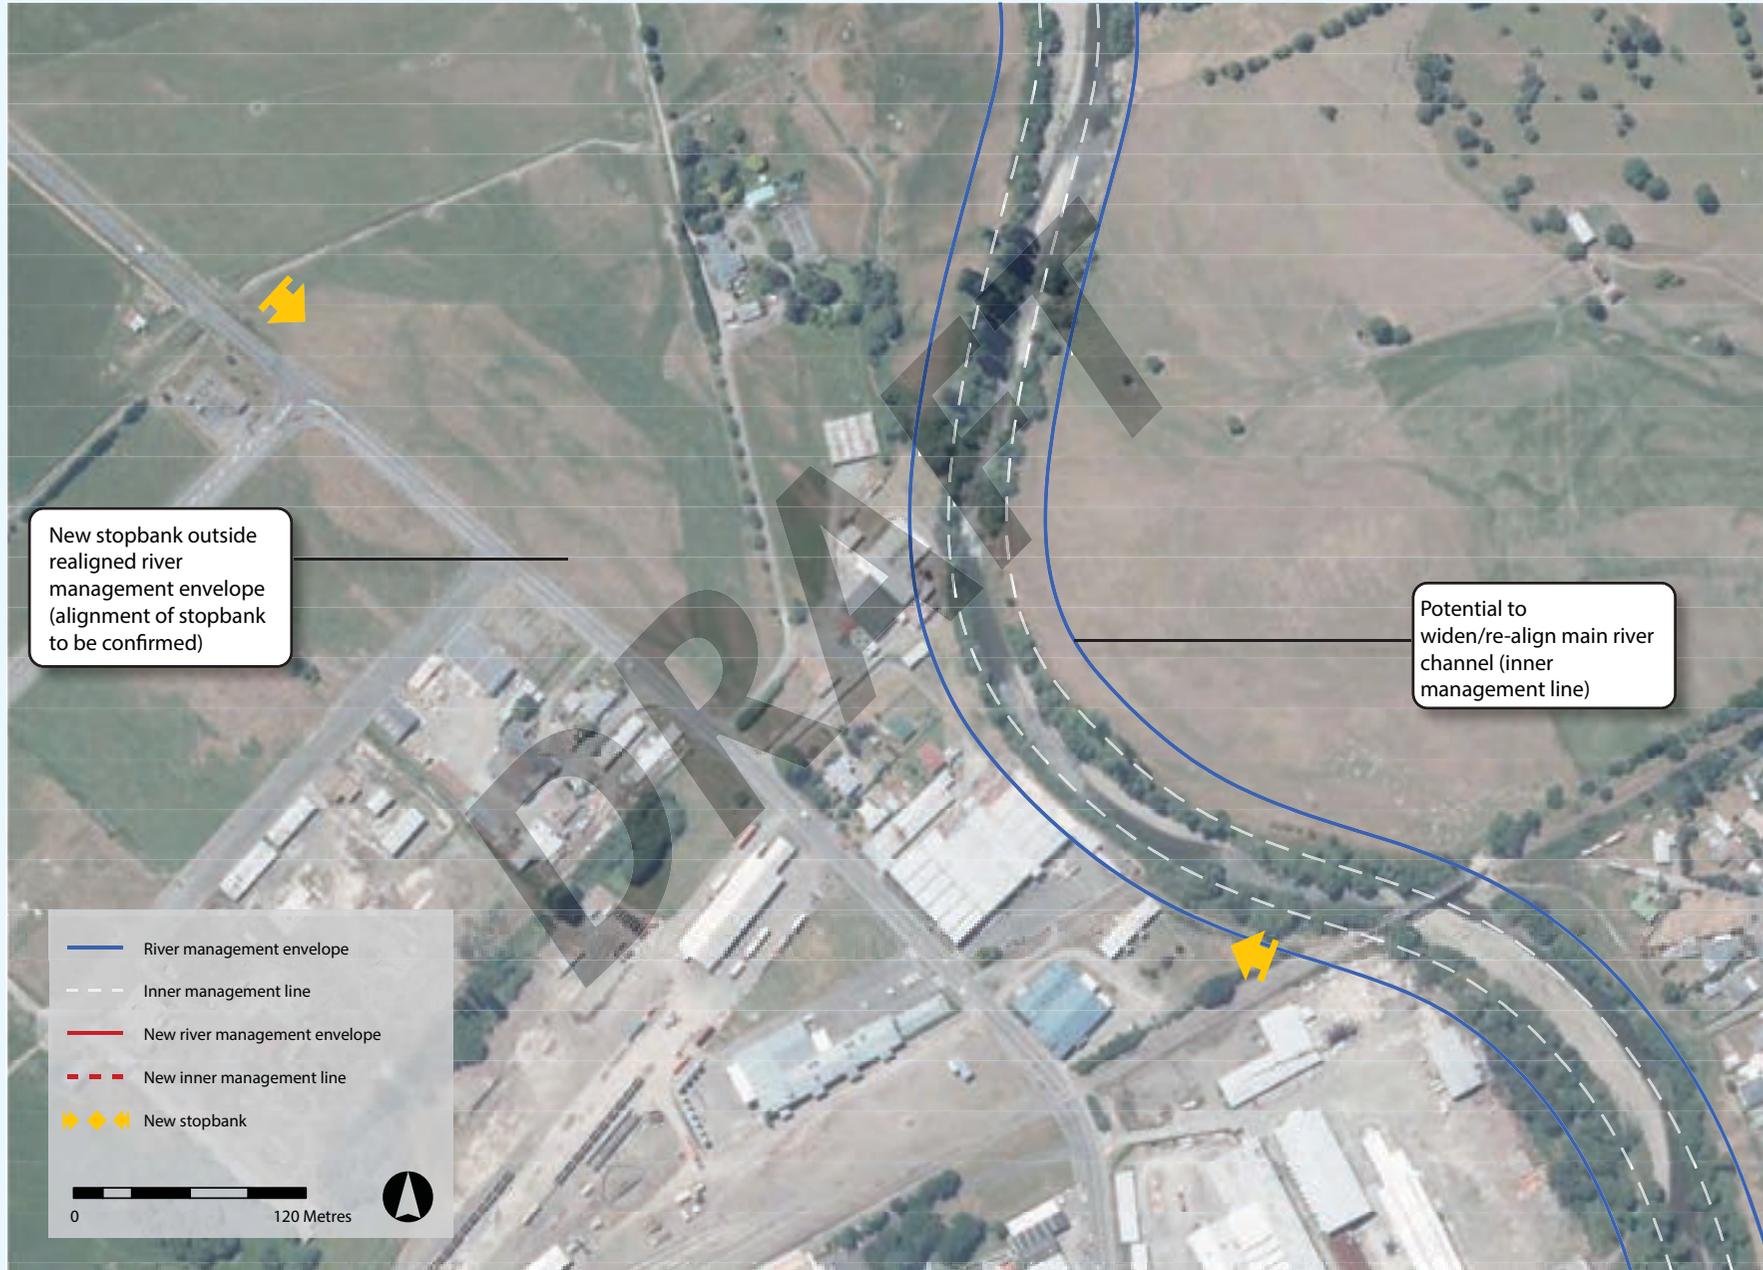

The third stage of the project response reduces the risk in the remainder of the flood risk issues from the 1% AEP flood event, and specifically the flooding of industrial properties upstream of the railway line, in the vicinity of Akura Road. This will be achieved through the construction of a stopbank system within Reach 12. The design of this stopbank could be incorporated into Stage 2 (above).

1. Design and construct 1% AEP flood risk management improvements:

- a Complete the full design stages and construction of the proposed stopbank upgrades in Reach 12.
- b Align with the optimised channel capacity and stopbank improvement concept which was developed in Stage 2.
- c Include provision within the designed flood risk protection scheme for improvements to be added in the future to allow for the predicted effects of climate change.

2. Develop and implement asset management plan:

- a Develop or update the existing asset management plan to ensure continued performance of flood risk management assets throughout the intended design life.

Stage 4: Review Responses/Measures and Understand Future Flood Risk

This stage aims to review and refine the uncertainties associated with the flood risk in the urban reach that is predicted in the future. This increased knowledge will inform the level of service and design event to be implemented to manage future flood risk. In addition, this stage would review the effectiveness of the measures already implemented and determine if any changes are required.

1. Review and update information:

- a Update hydrological data from within, or near to, the Waipoua urban reach and review uncertainties in model inputs. This will specifically inform the effects of climate change on the design flows of the Waipoua River and provide more confidence in the expected flood risk in the future.
- b Review the maintenance regime and residual risks of the 1% AEP flood risk management improvements, i.e. channel capacity and stopbank upgrades.
- c Review the effects from the implementation of the Te Kāuru FMP throughout the wider Waipoua River catchment, including consideration of the effects of wetland establishment upstream.

The FMP outlines extensive catchment management changes and major project changes to structures and river processes throughout the wider catchment (both upstream and downstream) which may influence the risk profile of flood hazard within the urban reach over time. These changes may influence the pathway and impact of climate change within the urban reach.

The FMP also outlines a major project response for realigning the Ruamāhanga River near the confluence of the Waipoua River. This will likely alter the flood risk profile at properties along River Road.

- a Review and confirm whether hydrological data is required (or needs updating), and whether more gauging stations should be installed.
- b Review the flood warning system and assess if it is still appropriate for the predicted risk profile or if it requires change/updating.
- c Review and assess whether emergency management plans are still applicable or whether they require changes/ updating.
- d Review whether land use changes and planning restrictions are still appropriate or require updating.
- e Share and engage with the community regarding updated flood hazard knowledge:

2. Whole of life asset management:

- a Consider ongoing review and adaption of the processes and structures developed in this major project response into the future.

Stage 5: Reduce Risk as a Result of Climate Change

Influences such as the implementation of Te Kāuru FMP, the effects of climate change and changing land use are likely to change the risk of flooding within the urban reach over time. Current climate change projections indicate that natural variations in climate are likely to be exacerbated and a trend of increased precipitation is likely across most of the country as well as increased intensity of storms, erosion of drainage networks and occurrence of landslides. These aspects will consequently significantly change the frequency of flood events and put increasing pressure on flood risk management schemes. However, the predicted effects of climate change are currently based on guidance which assumes a certain level of emissions that may not eventuate or may be exceeded.

Given the uncertainties in the effects of future risk, ongoing review of the processes and structures developed in this major project response are required into the future.

This stage addresses the future flood risk in the urban reach through continued channel capacity and stopbank improvements.

1. Design and construct 1% AEP + Climate Change flood risk management improvements:

- a Complete the full design phases and construction of these upgrades.
- b Develop an optimised concept which builds on the existing 1% AEP flood management scheme and addresses other areas of risk, including properties along River Road (as shown on page 25).
- c Include provision within the designed flood risk management scheme for improvements to be added in the future.

2. Update asset management plan to incorporate 1% AEP with Climate Change improvements:

- a Update the existing asset management plan to ensure continued performance of flood risk management assets throughout the intended design life.

Summary

A range of options have been considered for this major project response including upstream storage and the removal of at risk property. Both of these options had significantly higher costs (greater than \$30 million) and were not considered further. The approach of increased channel capacity and stopbanks was agreed as the most viable. The increased channel capacity is being considered in order to minimise stopbank heights but it will have medium term impact on the look and feel of the river channel and berms. The staged approach was developed to try to manage the affordability factor further. A detailed technical report regarding "Flood and erosion risk management approach development" is available from www.TeKauru.co.nz.

Assumptions

Assumptions have been made during the development of this response, some of which affect the provisional cost estimates provided below. The key assumptions, which will be reviewed during Stage 1, include:

- The integrity of the existing stopbanks is not suitable and reconstruction of the stopbanks is necessary
- Stopbank freeboard of 0.6m has been included for all new or rebuilt stopbanks
- The footprint of the stopbanks will be wide enough when initially constructed or rebuilt to enable an increase in the height of the stopbanks in the future to allow for climate change
- Material that is excavated from the river terraces to allow for increase channel capacity will be suitable for use in constructing stopbanks
- Stopbank alignments were estimated but will need to be further explored and refined.

Costs and Timing

The estimated costs for this major project response are summarised in the table below. The costs presented are indicative only and will be further refined through Stage 1 where factors such as stopbank alignment locations will be considered in consultation with the community.

The timeframes listed below are indicative only. They will be reassessed at the end of each stage and will be balanced with other council priorities.

STAGE	TIMEFRAME FROM TODAY	DESCRIPTION	ESTIMATED PROVISIONAL COST (2019 DOLLARS)
1 - PLANNING, ENGAGEMENT AND DATA COLLECTION	Over the next 2 years	Non-structural improvements which will improve understanding of the flood risk in the urban reach, raise awareness of the risks and heighten community preparedness. The existing level of service will not change with the implementation of this stage.	\$350,000
2 - ADDRESS HIGH PRIORITY AREAS	Between 2 - 5 years	Design and construction of a flood risk management scheme to address the flood risks of a 1% AEP event in the high priority areas (within urban reach upstream of SH2 and upstream of railway on the true left bank as shown on page 21). The design could include the 'Akura stopbank' proposed in Stage 3.	Estimated \$8,000,000 *costs are provisional and will be refined during Stage 1
3 - ADDRESS ALL 1% AEP FLOOD SENSITIVE AREAS	Between 5 – 10 years	Design and construction of a flood risk management scheme which will address the remaining flood risks of a 1% AEP event for all areas (Akura Road upstream of railway, as shown on page 23).	Estimated \$4,500,000 *costs are provisional and will be refined during Stage 1
4 - REVIEW PROCESSES AND UNDERSTAND FUTURE FLOOD RISK	Ongoing for the next 10 to 20 years	Review information and hydrological data that has been collected and reassess the uncertainties associated with the flooding risk in the urban reach. This will help to inform the effects of climate change on the hydrology of the Waipoua River and provide more confidence in the expected flood risk into the future.	Costs to be confirmed nearer the time, but estimated to be approximately \$150,000
5 - ADDRESS EFFECTS OF CLIMATE CHANGE	20 – 30 years	Design and construction of a flood risk management scheme which will address the flood risks of a 1% AEP event in the future, including the effects of climate change.	Costs to be confirmed nearer the time, but estimated to be approximately \$4,000,000

The forecast total cost is \$8 million, it is assumed that this will be funded using loan funded capital expenditure. This means the \$4 million would be funded by the regional rate and \$4 million from local share. The distribution of the local share will be discussed with MDC at the end of stage 1. Assuming the local share (\$4 million) is spread across all MDC rate payers, the rates impact will be an estimated \$7 per \$100,000 of capital value per annum, this includes the contribution to the regional rate. This rate will commence when Stage 2 implementation is underway.

Implications

The following implications associated with upgrading the flood management scheme within the urban reach have been identified:

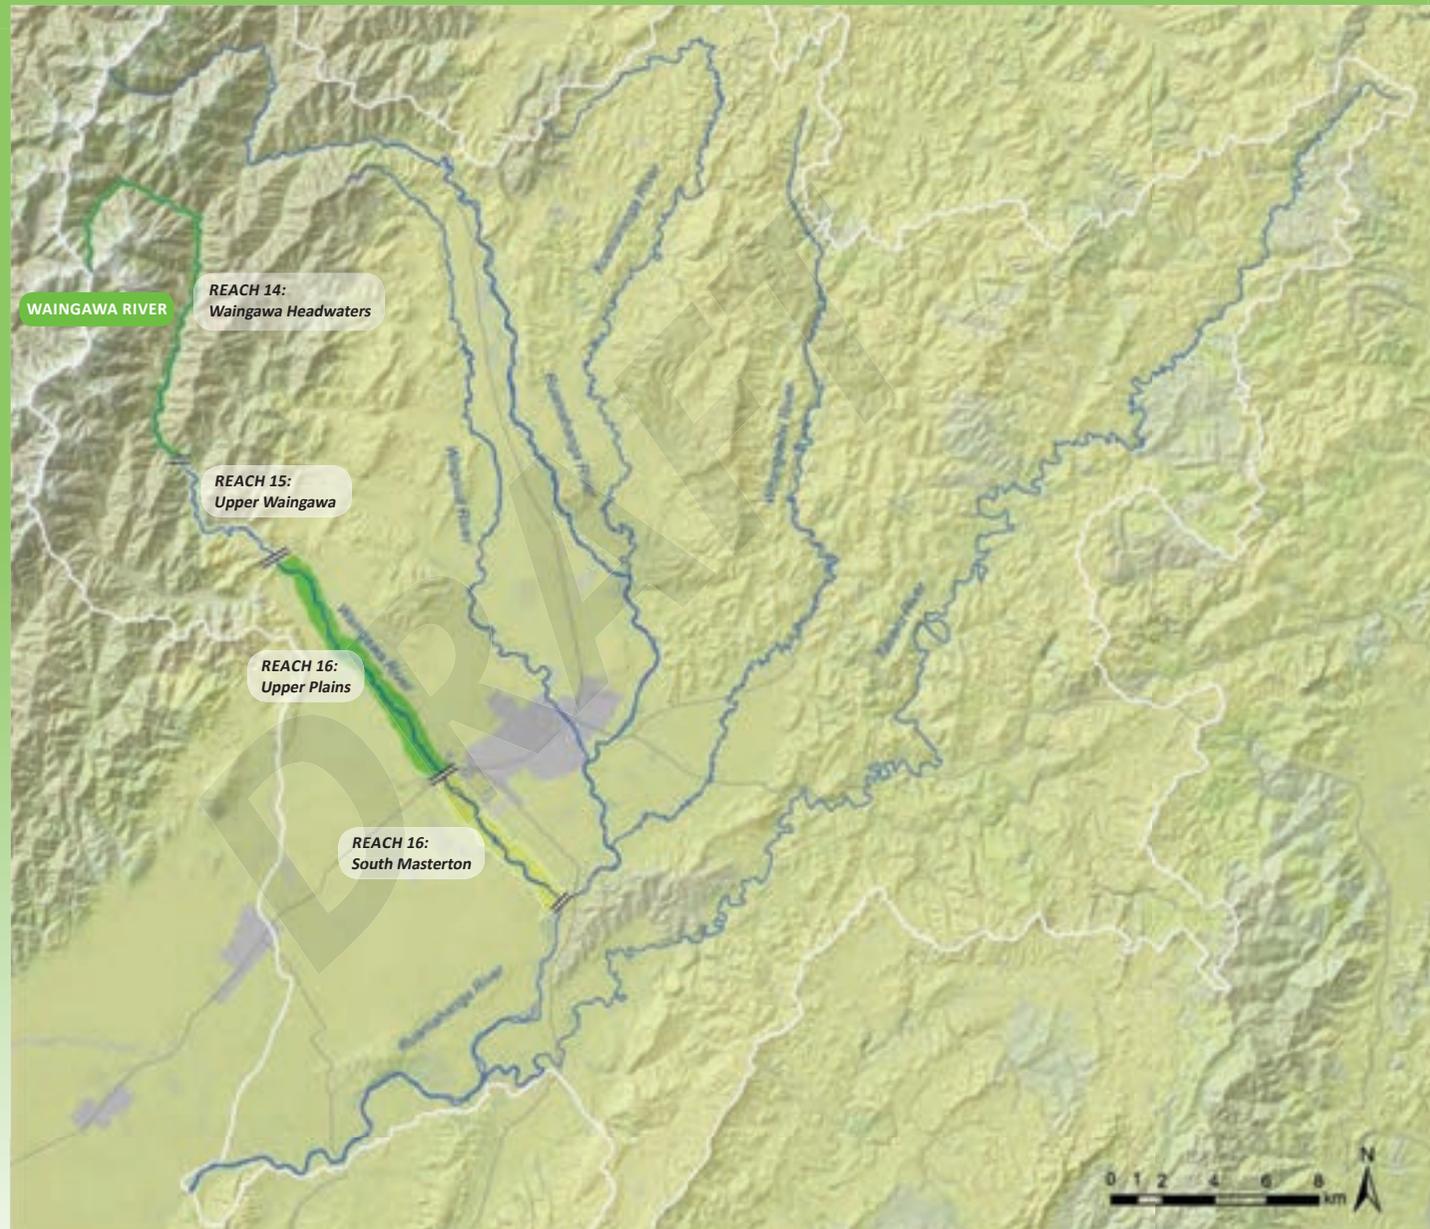

- The existing stopbanks will undergo significant geotechnical testing include intrusive investigations. The condition and integrity of the stopbanks will inform the extent of earthworks required to upgrade or replace the stopbanks. The stopbanks will be heightened in some areas and new stopbanks will be constructed.
- Extensive vegetation removal will be required along the river corridor. This clearance will primarily be located between the railway bridge and the SH2 bridge. Following the completion of works, a planting regime will be introduced and implemented which will predominantly consist of native vegetation and willows.
- For the proposed channel capacity improvements, earthworks will be required throughout the river corridor to excavate and remove material. This material will be utilised for upgrade of stopbanks where possible or disposed of off-site. The lowered terraces will then be grassed and appropriate vegetation will be introduced.
- New land use designations will be required throughout the river corridor and some property may be required to be purchased to allow for the construction and maintenance of the scheme.
- Consultation with the community will be undertaken during the detailed design stage to understand the aspirations for stopbank locations, costs, the finished river corridor and use of newly developed spaces.
- There will be no adverse effects to the existing weirs and bridge structures within the river.

Priority

Stage 1 of this response is classified as high importance and high priority.

Level of Service

A 1% AEP level of service is initially proposed for the entire urban reach, with allowance for increases in the future to allow for the effects of climate change and uncertainties in the model.

Waingawa River

8. Waingawa River

The Waingawa River flows from the Tararua Ranges into the Ruamāhanga River to the south of Masterton. The upper reaches of the river commence in the Tararua Forest Park and flow out onto the Wairarapa Plains from the confluence with the Atiwhakatu Stream near Kaituna.

The Waingawa River was known historically to change its course often. As the river moved and shifted across the plains, some sections of river channel were left isolated. Over time these isolated river channels developed into wetland areas. The name Waingawa stems from the name given by Haunui-a-Nanaia, 'Waiawangawanga' which means troubled or uncertain waters. Like many traditional names, the Waiawangawanga has been shortened to Waingawa for easy pronunciation.

Within the Upper Wairarapa Plains, the river widens to form a broad semi-braided form which follows a fairly direct alignment towards the Ruamāhanga River over a distance of approximately 17km. Here the bed of the river is typically contained by willow margins, with further pockets of remnant forest also retained on terraces which step from the river.

The Waingawa floodplain soils are formed from greywacke alluvial parent materials from the Tararua Ranges. Land use in the catchment is a mix of native forest in the upper catchment transitioning to a range of primary production activities within the Wairarapa Plains. The middle section of river also adjoins rural lifestyle development, and urban areas (Masterton) including the Hood Aerodrome.

Key recreational values include kayaking and wilderness fishing in the upper catchment, with much reduced amounts of these occurring downstream of the foothills (although kayakers are frequently seen in this area close to good vehicle access points where they can get out of the river). Jet boating is also noted as a recreational activity in the lower reaches.

The Waingawa River is an important ecological corridor. Of particular note is the Atiwhakatu Stream tributary, which is noted as a significant fish spawning area. Both rivers contribute to the diversity of fish species present in the study area, and are important for both native and exotic species. The Waingawa River is also the second of the important nesting sites for banded dotterels, and a number of other valued species have been recorded along the river including black shag, pied stilt, black billed gull, and NZ pipit.

The ecological value is reflected in its cultural values, which are linked to wetland areas that formed in cut off channels and old backwaters, becoming areas valued for mahinga kai. It is important to note that the mahinga kai value of the Waingawa River carries across to both Parkvale Stream and Booths Creek. Cultural relationships between these streams, the Waingawa River, the Mangatarere River and the Waiohine River, illustrate the intricacies and complex interconnectedness present within catchments.

General Issues

The Waingawa River is respected by people who live nearby as a high-energy river. This river is mostly entrenched within a fairly tight, naturally-confined floodplain. This means that much of the flooding – even in a large flood event – is contained by naturally-formed historic river terraces from where it enters the Wairarapa Plains until it joins the Ruamāhanga River near Te Whiti. The erosion risk, both modelled and observed, is of much greater concern. The energy of the river regularly reshapes its main channel, and after each flood event the bed of the river is scattered with the remains of trees and vegetation eroded from banks.

Areas of high value, healthy native forest in the upper catchment of the Waingawa are exposed to flooding. On the narrow floodplain within the foothills, the land-use is predominantly lifestyle properties and small holdings with some primary production activities. A small band of industrial processing and production activities is located adjacent to Masterton around the two bridges.

The Waingawa River also contains a number of locations where critical or high value infrastructure sits within or near to the active river corridor. These include the water supply intake and pipeline to Masterton, and the associated treatment plant. In addition, the Masterton-Wellington railway line and SH2 cross the river near Masterton. The Hood Aerodrome runway has also been threatened by erosion risk on a number of occasions. Measurements of the land lost to erosion between 1941 and 2012 along the length of the river indicate that approximately 210 hectares of land which would not have previously been classified as river channel has been lost to erosion. In addition the Waingawa River creates challenges for the establishment of vegetated buffer areas due to its deeply cut channel with areas of vertical river bank.

Waingawa Headwaters – Reach 14

Character

The headwaters of the Waingawa River flow through the Tararua Forest Park. In this area the river passes through bush clad gullies with rock lined gorges, narrow boulder gardens with rapids and pools extending a wilderness character along the course of the river.

Key Characteristics

Bush clad gullies

Rock lined gorges and bolder gardens

Limited visible human presence

Key Floodplain Management Points

- Encourage continued recognition of the values and character of this reach
- Support initiatives that aim to preserve or improve the natural values of this reach

There is no intent to carry out any form of maintenance activity within this reach as part of the Floodplain Management Plan. There are no specific flood and erosion issues identified for this reach.

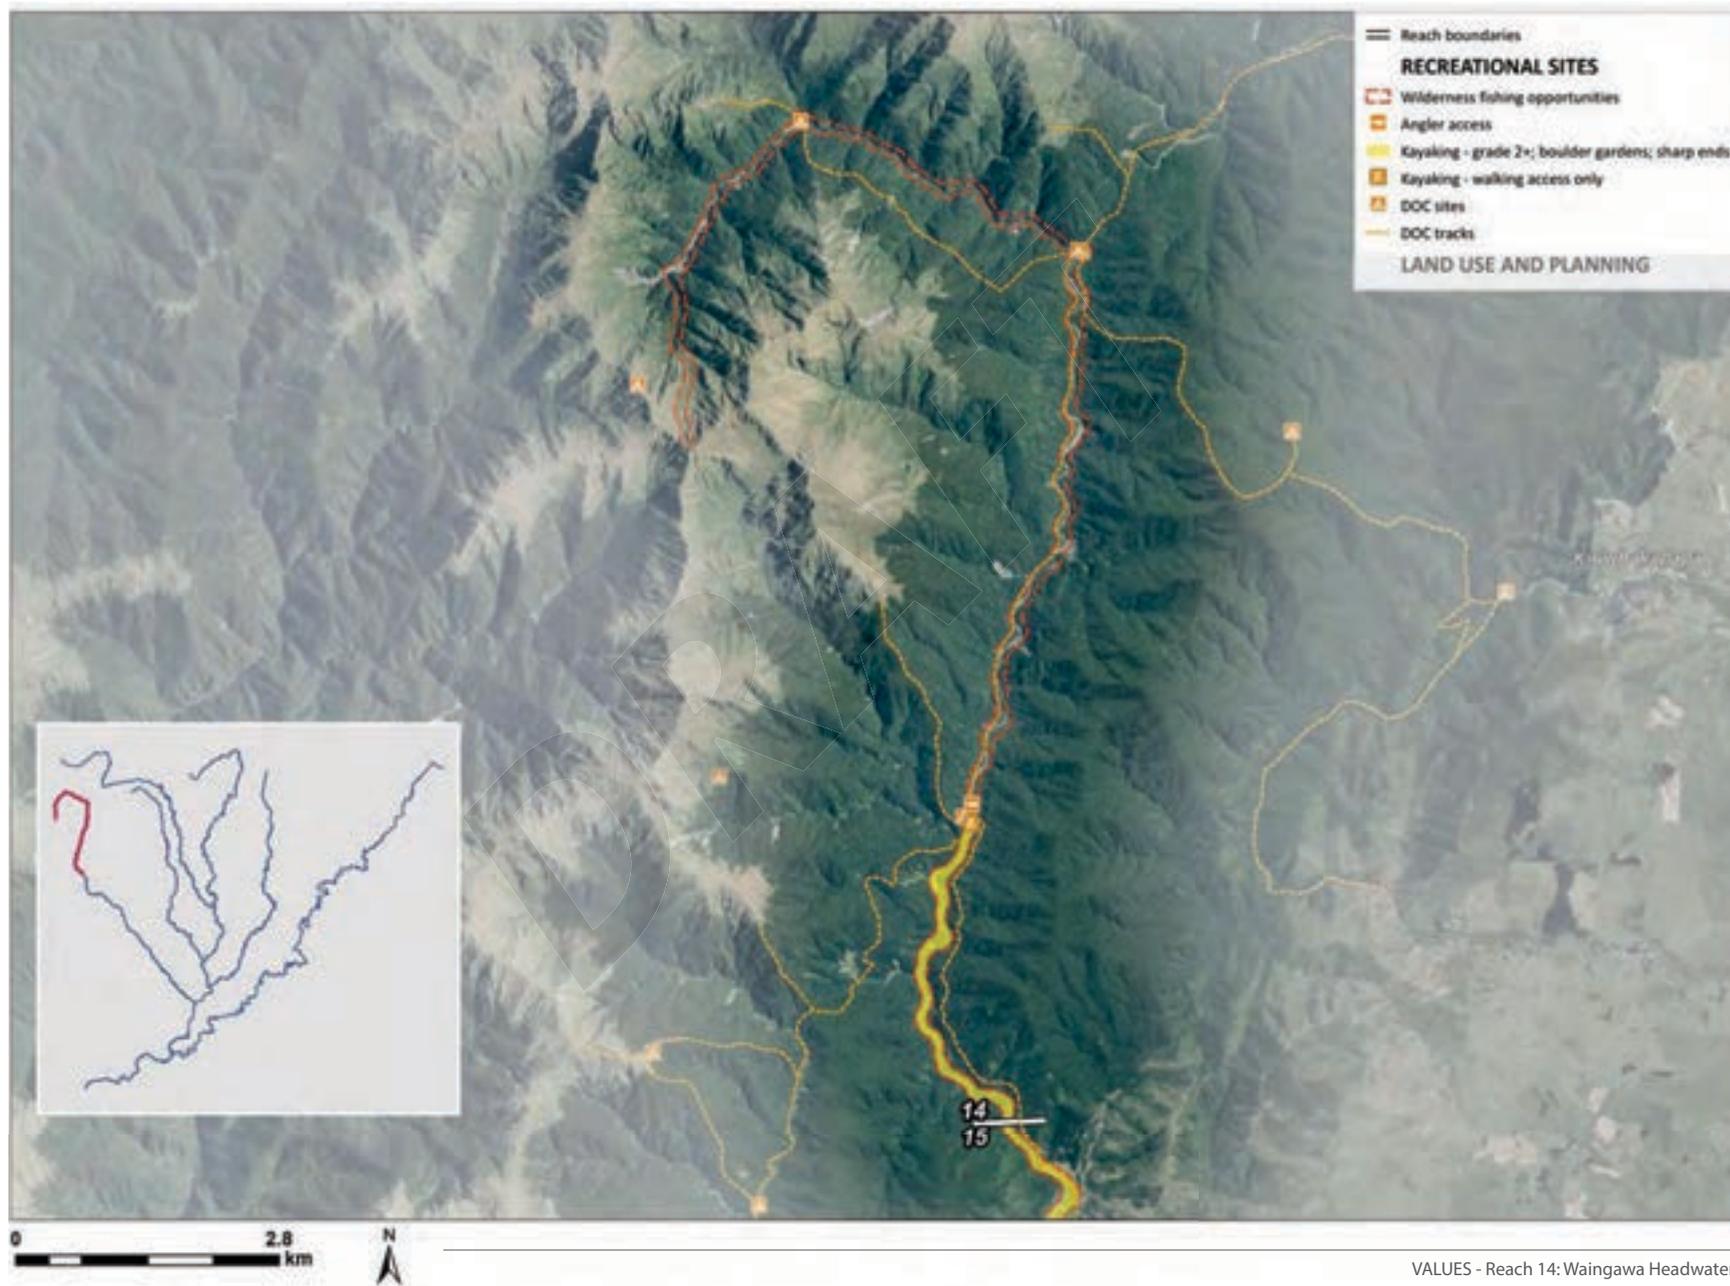

Values

The headwaters of the Waingawa flow through fenced and unfenced indigenous vegetation protected as part of the Department of Conservation Estate. Rock lined gorges framed with native beech and podocarp forest exhibit very low levels of landscape modification with corresponding very high scenic value. The entirety of this reach is zoned Rural (Conservation) in the WCDP (2013).

Due to the underlying strong wilderness and scenic values, this reach has a number of popular walking and tramping tracks with huts leading into the Tararua Ranges. Additionally, it sees use for wilderness fishing, and some grade 2+ kayaking along boulder gardens and sharp ends. Mitre Flats is a popular fishing and kayaking area along this reach of river with foot access only.

	ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES
COMMON METHODS		Entire reach	River management	Isolated works support, Code of Practice
		Entire reach	Planning and policy	Protection against deforestation in upper catchment
		Entire reach	Emergency management	Emergency management planning, flood forecasting and warning system
		Entire reach	Environmental enhancement	Community Support Officer

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES
LANDSCAPE MODIFICATION	SCENIC VALUE

VALUES - Reach 14: Waingawa Headwaters

Upper Waingawa – Reach 15

Character

The Upper Waingawa River flows from the Tararua Ranges through an area of low lying foothills separating the headwaters from the wider Wairarapa Plains. As the river emerges from the Tararua Forest Park, the river begins to develop a semi-braided form dispersed between rock lined gorges. The margins of the river continue a dominant cover of native vegetation separating the river from surrounding low intensity rural use. The valley floor associated with the river also includes increasing areas of rural lifestyle use.

Key Characteristics

- Discrete semi-braided areas separated by narrowed rock gorges
- Continuous bands of native vegetation framing the river margin
- Recent rural lifestyle expansion along the valley floor in some areas

Key Floodplain Management Points

- Work with MDC to improve the security of the Masterton water supply, including intake, pipe crossing and pipe line
- Apply isolated works policy for all maintenance works. No river scheme is established in this reach

Values

This reach of the river is slightly more modified than the Waingawa headwaters which flow through Tararua Forest Park. Gorges with rapids and pools continue wilderness recreation opportunities along the course of the river against a backdrop of areas of native broadleaf plants. Where the river begins to widen, exotic shelter belts and pasture grassland become established along the river margins, with areas of rural lifestyle settlement also established along the lower parts of this reach. This has resulted in a low level of landscape modification overall and a retention of high scenic value.

Walking tracks providing angler and kayak access continue from road ends occurring along this reach, with popular semi-wilderness recreation sites identified at the Blake Stream Confluence and The Pines. The latter site also forms a popular swimming area at the end of Upper Waingawa Road.

Terrestrial habitats with identified ecological values along this reach include fenced indigenous forest, unfenced indigenous forest, mixed exotic-indigenous forest, indigenous treeland, stonefield and boulderfield.

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES
LANDSCAPE MODIFICATION	SCENIC VALUE					
Low	High	Walking tracks (DOC), angler access, kayak access, swimming, kayaking, fishing	-	-	Rural (Conservation), Rural (Primary Production), Rural (Special), Road, River, Water Supply Intake.	Fenced indigenous forest, Unfenced indigenous forest, Mixed exotic-indigenous forest, Indigenous treeland, Stonefield and boulderfield

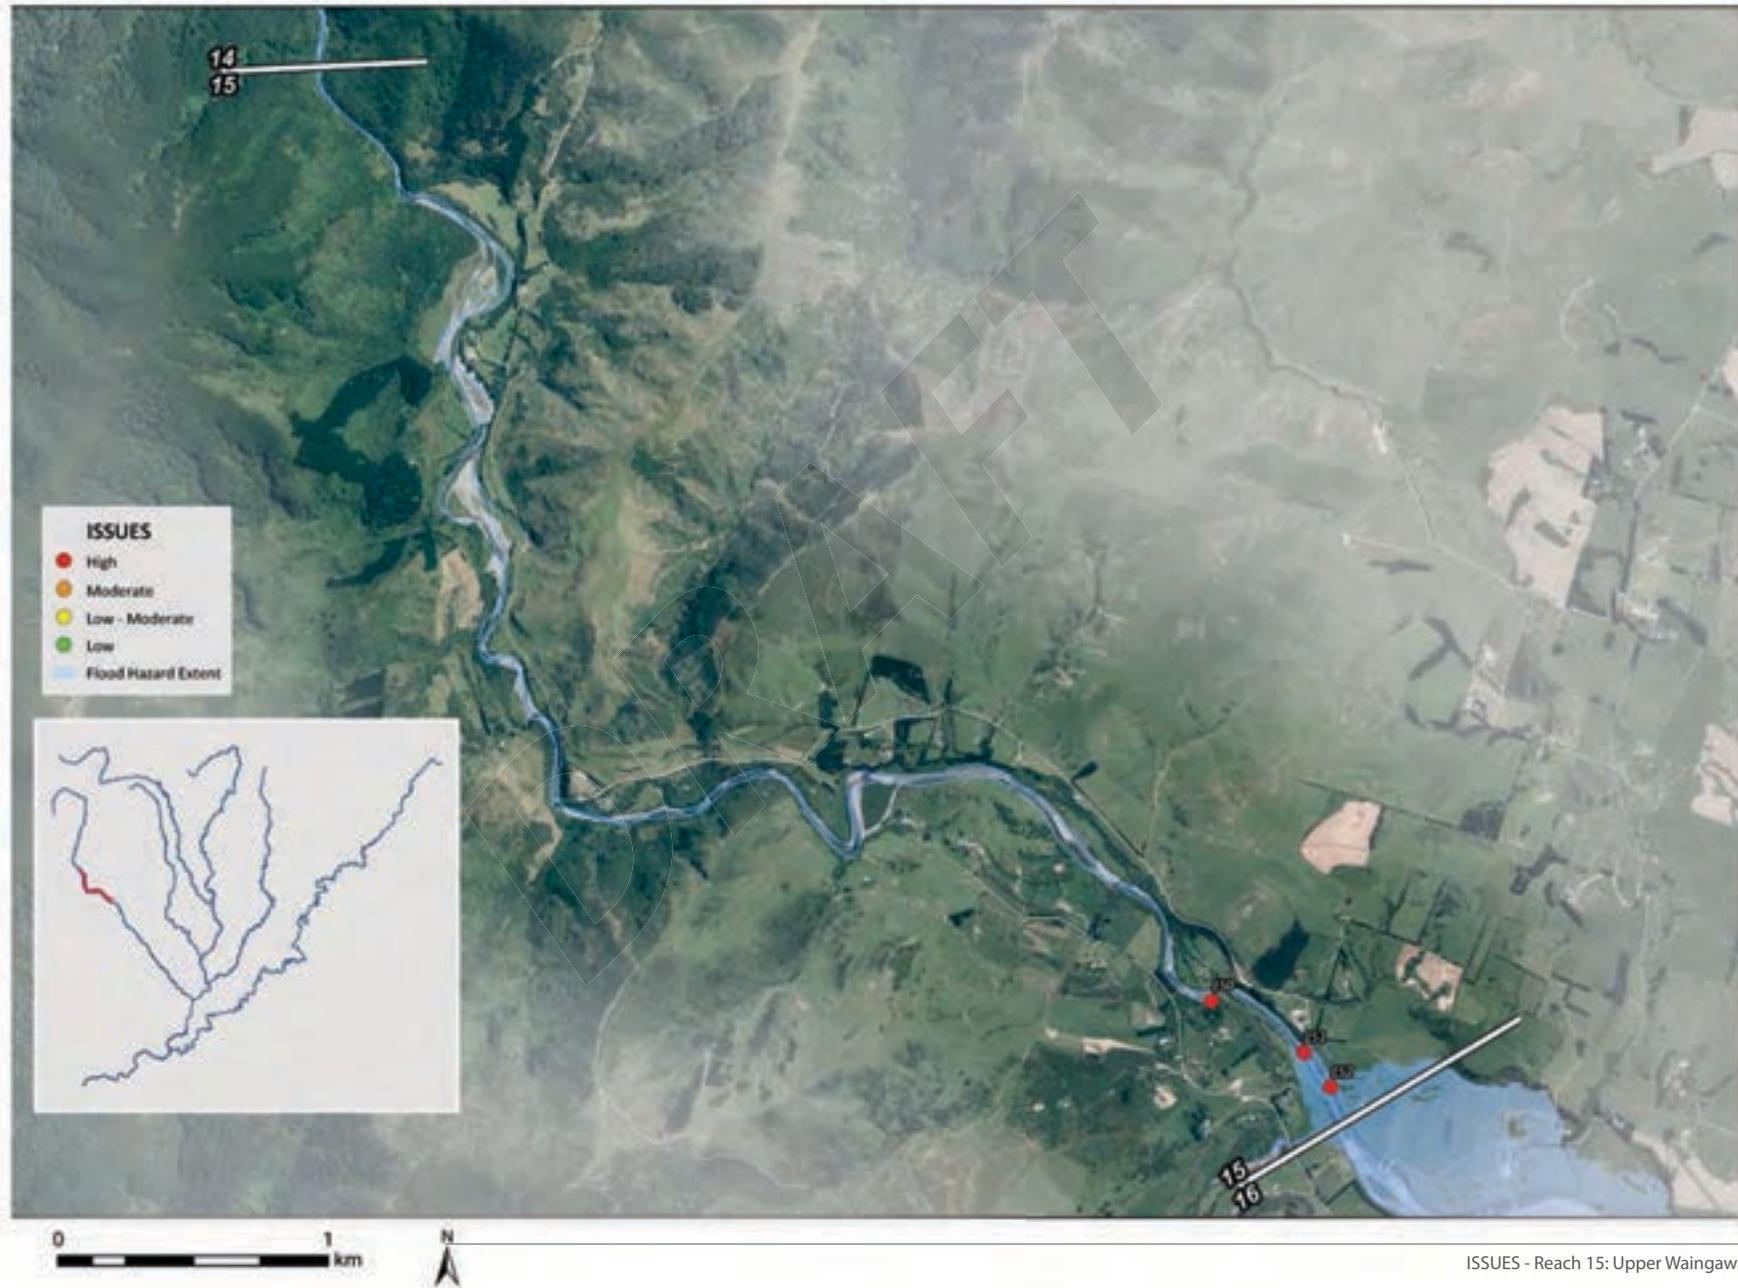

Upper Waingawa – Reach 15

Flood and erosion issues

Four erosion and flood management issues are identified along this reach, predominantly associated with Masterton’s water supply. Issues have been ranked according to their consequence and likelihood (i.e. risk) and assigned an ID number [xx].

LOW	
LOW TO MODERATE	
MODERATE	
HIGH	<p>Masterton District Council water supply intake [150] The water supply intake for Masterton is located in the foothills area and within a stable gorge-like section of the river. It does sit within the erosion study area. No known issues exist with this intake point.</p> <p>MDC water supply pipe bridge [151] The river bed in the vicinity of the pipe bridge is subject to fluctuation, increasing risk of debris flow or scour to structure. Damage to this structure, which may occur as part of a large flood event, would have very significant consequences for the population of Masterton and therefore this issue is considered high priority.</p> <p>MDC water supply pipeline [152] The water supply pipeline runs through a narrow strip of land between the river bank and the road. This is under ongoing erosion pressure requiring ongoing management and maintenance of protection assets. Damage to this structure would have significant consequences for the population of Masterton.</p>

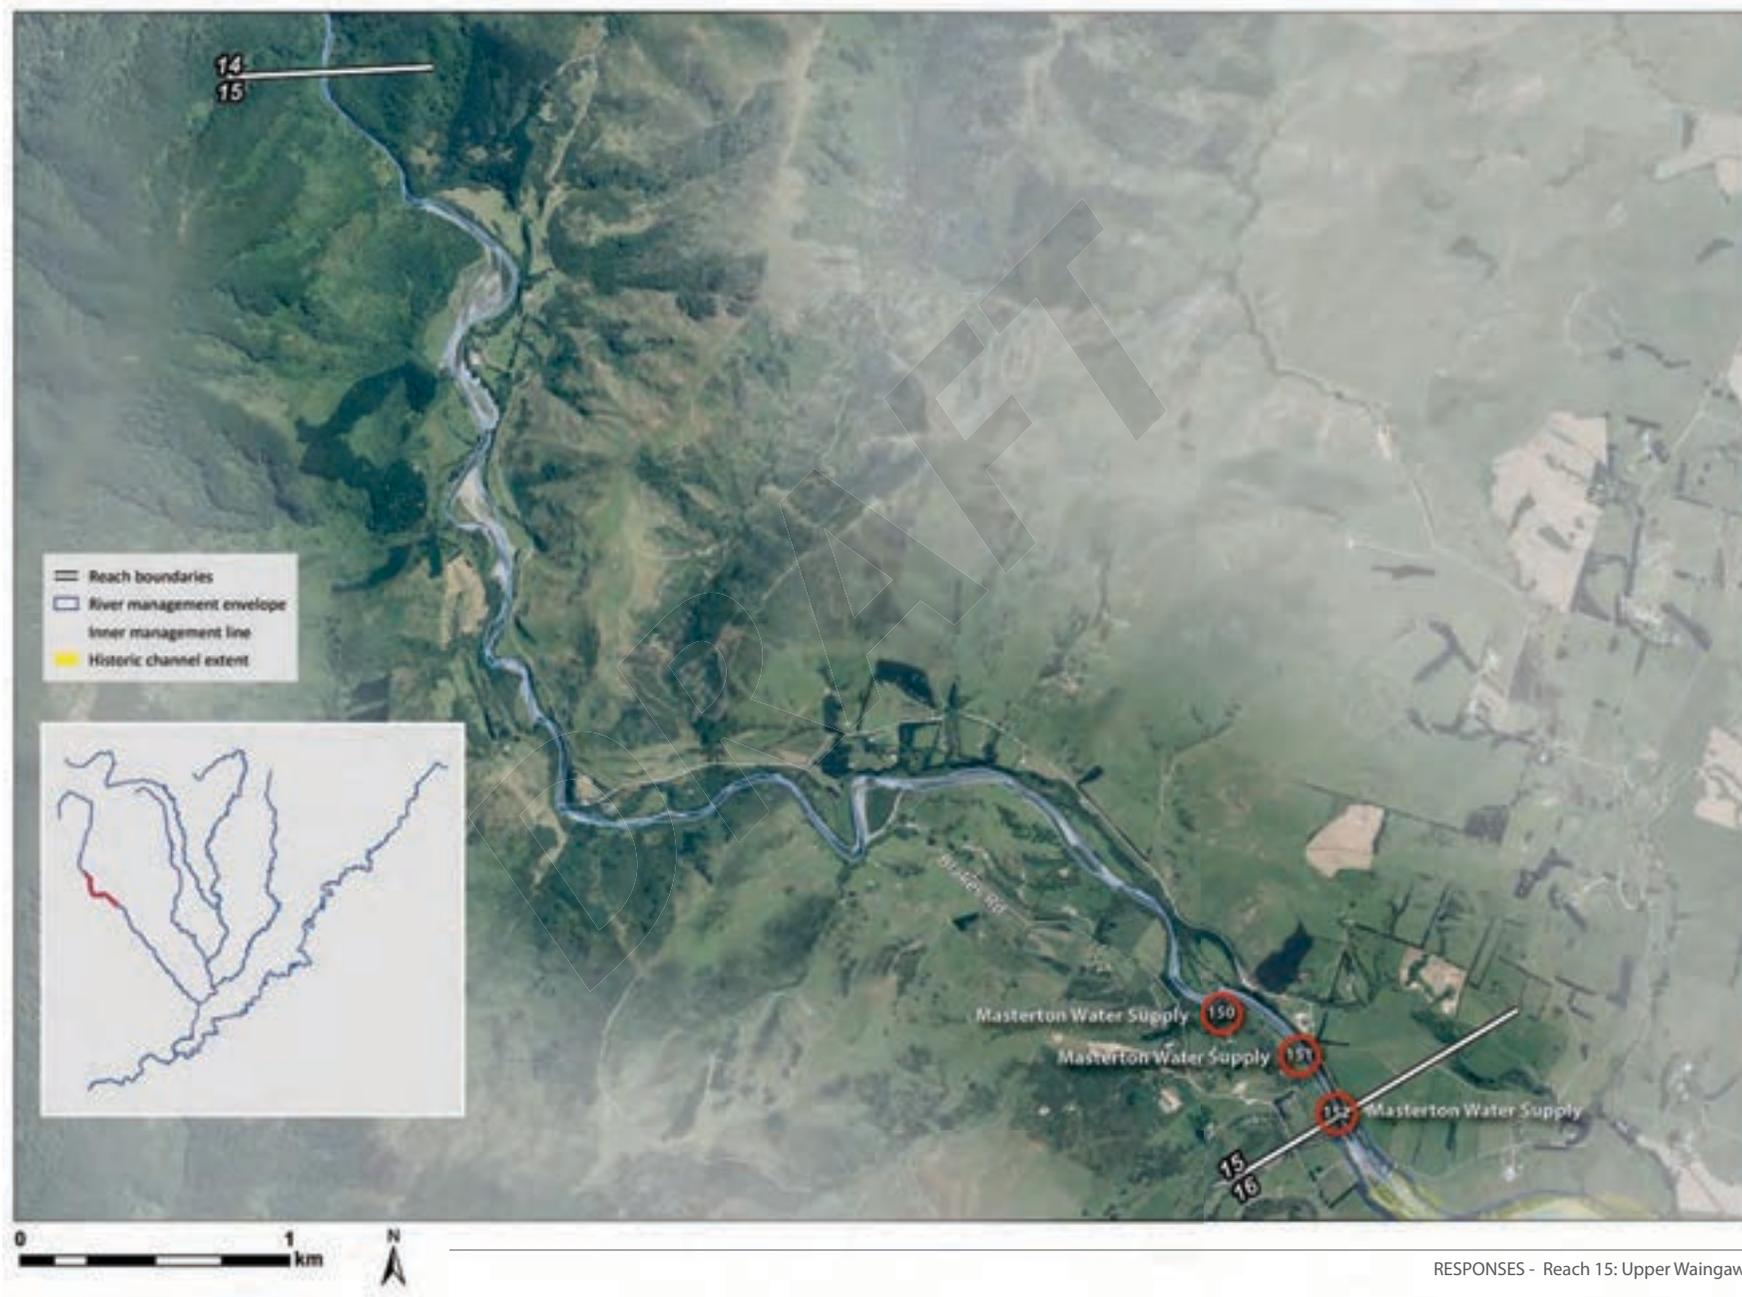

Upper Waingawa – Reach 15

Response

Common methods and specific responses that apply to this reach are set out below. The common methods used to address specific issues are listed in *Appendix 5*.

Reach Specific Responses

	ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES	LEVEL OF SERVICE (AEP)		RESPONSIBILITY		PRIORITY
					CURRENT	TARGET	PRIMARY	SECONDARY	
SPECIFIC RESPONSES	150 151 152	Masterton water supply	River management	Provide continued advice and support to MDC with regard to operation of water supply infrastructure. Continue to provide erosion protection to the supply pipeline as a priority for the Waingawa River. Refer to the MDC Raw Water Supply Pipeline major project response (page 94).		1%	MDC	GWRC	High
		Various sites	Environmental enhancement	Formalise an access point to river at Upper Waingawa Road, and explore other sites such as Black Rock Road, South Road, Hughes Line. Initiate a care group and work with clubs that use these locations to maintain the sites and provide suitable and safe access to the river. Maintenance of site to be provided by community supported by local authorities.			GWRC	Community	Medium
COMMON METHODS		Entire reach	River management	River edge envelope, river bed level monitoring, recognition of buffers as a river management tool, pool-riffle-run envelope, historic channel lines, isolated works support, Code of Practice, mixed vegetation planting, alternative land uses within planted buffers					
		Entire reach	Planning and policy	Protection against deforestation in upper catchment, land use controls, flood hazard maps, rural stopbank policy, scheme decision policy, abandonment/retirement of assets, land access & strategic land purchase

		Entire reach	Environmental enhancement	Environmental strategy, Community Support Officer, care group and clubs					

RESPONSES - Reach 15: Upper Waingawa

Upper Plains – Reach 16

Character

From the confluence with the Atiwhakatu Stream, the Waingawa River emerges onto the Masterton Plains from an area of undulating hills. The State Highway 2 Road Bridge is the landmark delineator between reach 16 and the lower reaches of the Waingawa River. In this area, the river establishes the twisted semi-braided form from which its name is derived.

The margins of this corridor include willow planting and native vegetation. Beyond the river corridor, terraces accommodating mixed agricultural use and vegetation step above the river corridor. Vegetation includes a significant stand of totara and kahikatea surrounding the Masterton Water Treatment Plant along the true left bank of the river, and a significant stand of native forest on the true right bank. Lifestyle blocks are prevalent along Norfolk Road.

Key Characteristics

Semi-braided form with islands visible from SH2 Bridge

Margins of mixed willow and remnant native forest

Increasing settlement in proximity to Masterton

Values

This reach continues through rural land used for primary production that is predominantly established in pasture. River re-contouring works become more frequent in this area, alongside areas of willow planting and large areas of indigenous vegetation. Overall this reach has undergone a low to medium level of landscape modification and has medium / high levels of scenic value.

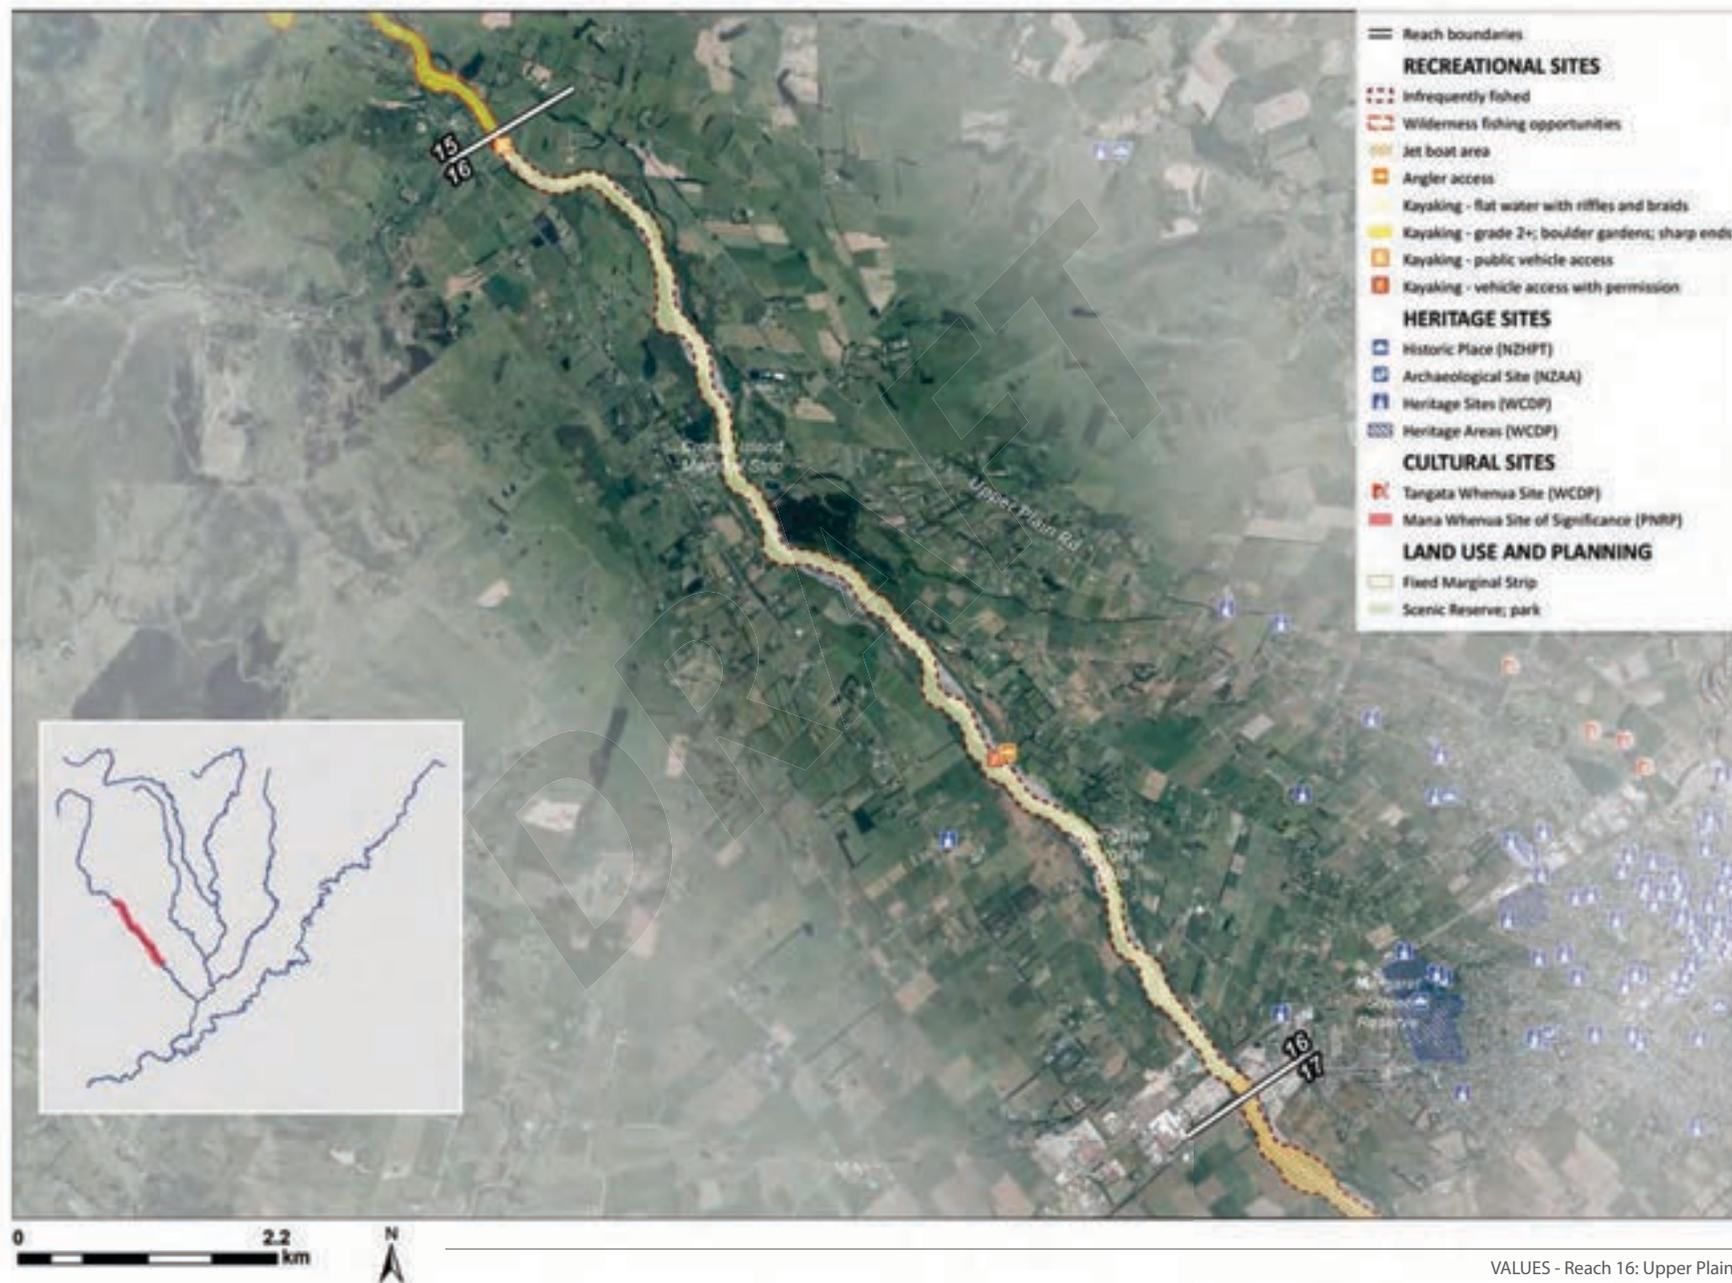

Some kayaking continues along this reach resulting from the flat water with riffles and braids. The naturally shifting course of the river results in an unstable environment which is infrequently fished, whilst remaining important for fish passage. Access for both kayaking and fishing is obtained at the end of Skeets Road.

Important ecological values identified along this reach include the Waingawa River Bush RAP site, and identified terrestrial habitats include unfenced indigenous forest, mixed exotic-indigenous forest, indigenous treeland, stonefield and boulderfield.

Key Floodplain Management Points

- This FMP will shift the focus of river maintenance towards more intensive implementation of vegetated buffers. The design buffers will be allowed to erode when and where appropriate. This method will substitute the immediate response to erosion issues with the machinery in channel works practiced in the past
- This FMP will increase river enhancement works.
- Protect the Waingawa River Bush RAP site from negative impacts of flooding and erosion
- Work with MDC to improve the security of the Masterton water supply, including pipe line and treatment works
- Maintain the additional protection for Masterton provided by the Skeets Road stopbanks
- Work with Carterton District Council to maintain the erosion security of the Taratahi water race intake
- Work with the asset owner of the electricity distribution network to relocate pylons outside of the active channel
- Address the security concerns regarding the stopbank between the SH2 and rail bridges and promote relocation of this industrial area outside of the flood zone, and possibly redefine this area of land into a public recreation site
- Work with the infrastructure owners of the railway bridge and road bridge to ensure their continued operation and security
- Work with the Wairarapa Water Use Project in relation to dam and irrigation proposals within the vicinity of this reach

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES

Waingawa River Bush (RAP), Unfenced indigenous forest, Mixed exotic-indigenous forest, Indigenous treeland, Stonefield and boulderfield

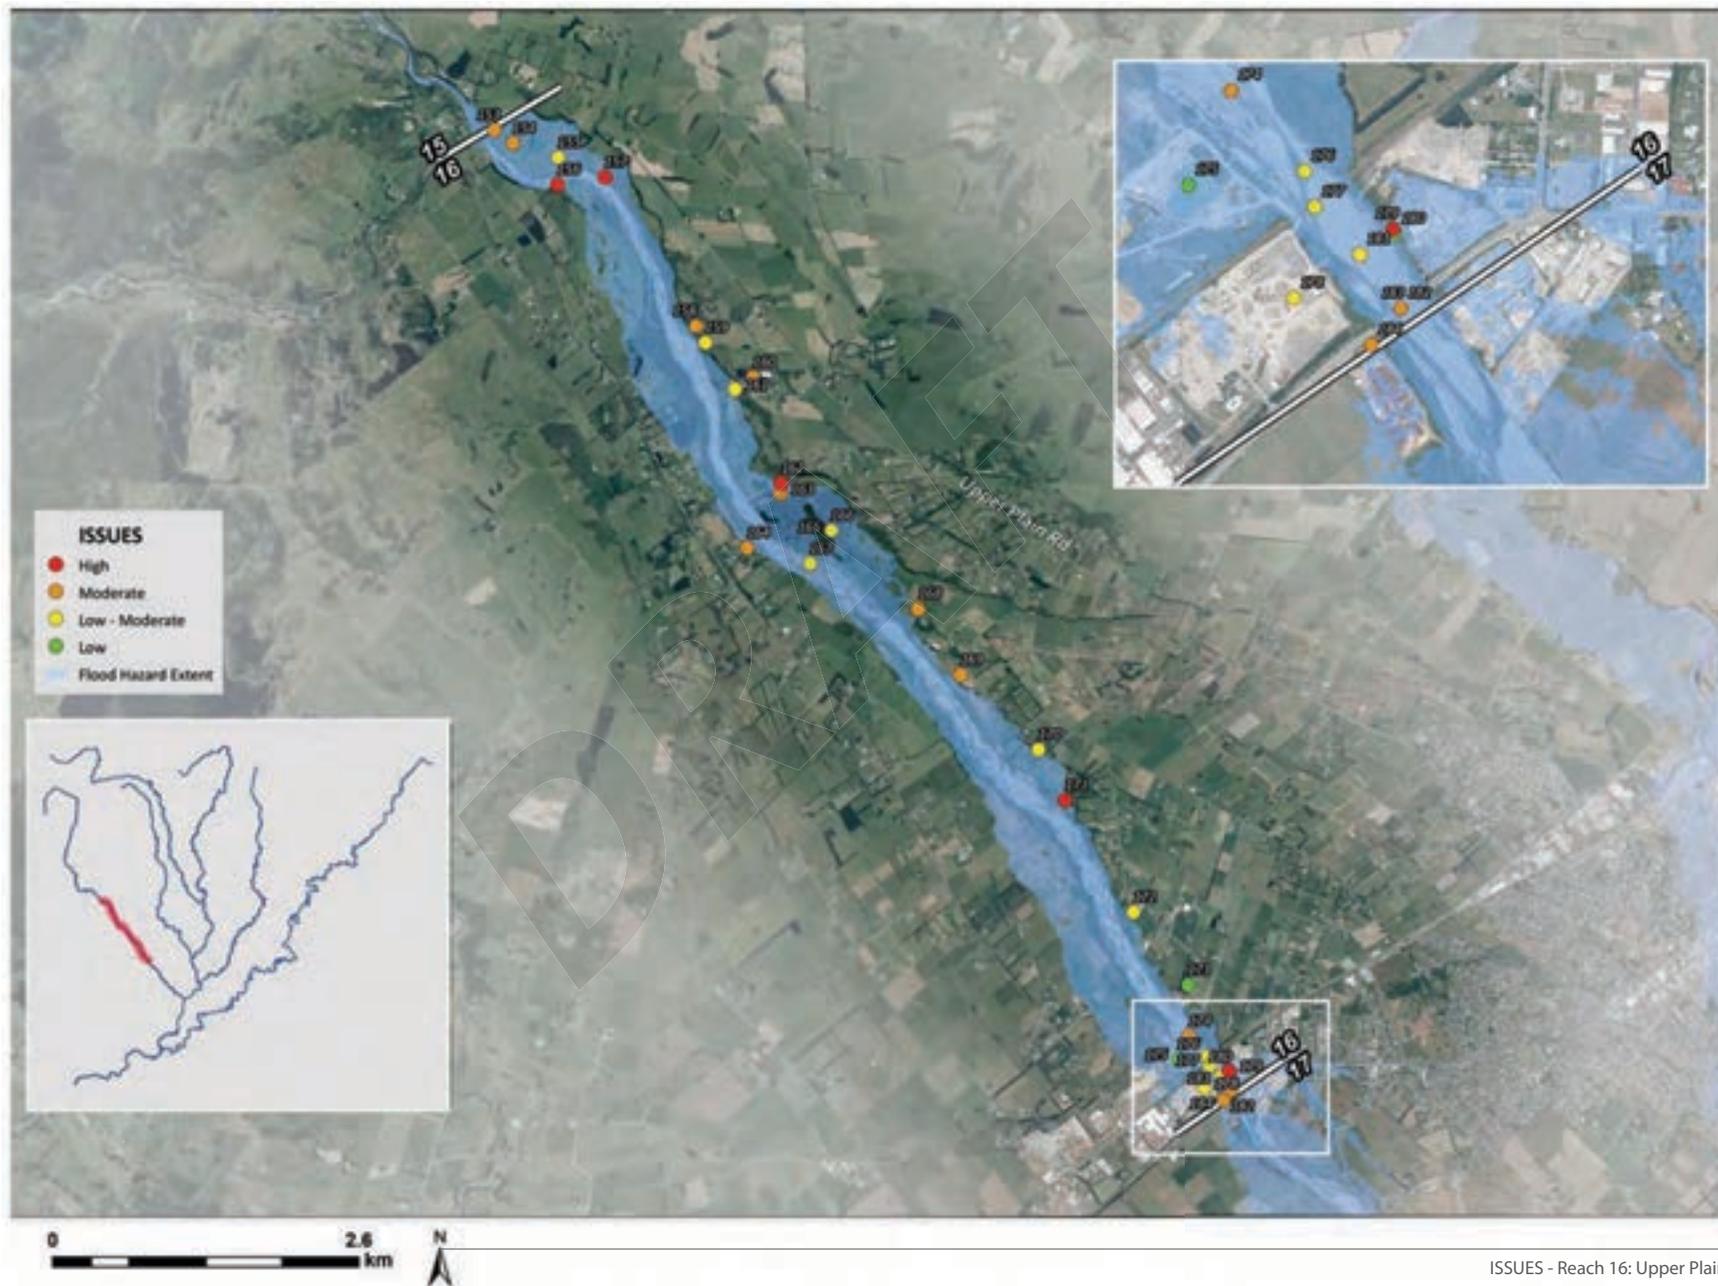

VALUES - Reach 16: Upper Plains

Upper Plains – Reach 16

Flood and erosion issues

A total of 29 erosion and flood management issues are identified along this reach, predominantly associated with water supply and rural development west of Masterton. Issues have been ranked according to their consequence and likelihood (i.e. risk) and assigned an ID number [xx].

LOW	<p>MDC water supply future treatment site [165] The site designated for potential future water treatment site sits within the erosion study area and modelled 1% AEP flood extent. No currently managed issues exist.</p> <p>SLUR site [173] A site on the selected land use register (SLUR) which sits within the erosion study area.</p>	<p>Contractors yards [175] Contractors yards are located within the erosion study area and are affected by modelled 1% AEP flood extents.</p> <p>Channel alignment [180] The buffer zones on the true right bank between the two bridges are very narrow and have been recommended for review.</p>
LOW TO MODERATE	<p>Farm buildings [155] A number of farm buildings including a milking shed sit within the modelled 1% AEP flood extents and erosion study area. No currently managed issues exist.</p> <p>Houses [159] Houses are located within the erosion study area.</p> <p>MDC Water Treatment Plant – sludge treatment area [161] The sludge treatment sections of the water treatment plant are located on the lower river terraces and within the erosion study area. No currently managed issues exist.</p> <p>Historic river channel [166] An old river channel sits within the overflow path of the updated 1% AEP flood. The old gravel river bed has been planted over and closed off with a stopbank.</p> <p>Channel alignment [167] A lack of buffer zones at this location has created ongoing management issues and difficulty in maintaining the river within agreed design lines. The true right bank erosion currently extends beyond the designed buffer.</p>	<p>Flaggates in stopbanks [170] Two flaggates in Skeets Stopbank create possible back flow routes. These are occasionally blocked open because of misunderstandings about their purpose and use.</p> <p>Buildings [172] There are several buildings which sit within the erosion study area and modelled flood extents. No currently managed issues exist.</p> <p>Transmission powerlines [176] Pylons just upstream of the Railway Bridge sit on the berms and are within the erosion study area. No currently managed issues exist.</p> <p>Rail bridge [177] Bed degradation is a managed and known issue in the area around the railway bridge.</p> <p>Contractors yards [178] Contractors yards are located within the erosion study area and affected by the 1% AEP flood extent. Known erosion management issues exist in this area.</p> <p>Sewer and water Supply pipeline [182] Both sewer and water pipelines are clipped to the road bridge across the Waingawa. No currently managed issues exist.</p>
MODERATE	<p>Upper Waingawa Road [154] The Upper Waingawa Road is modelled to be flooded to a depth of up to 0.9m in a 1% AEP flood.</p> <p>House [153] A house is located within the erosion study area and modelled 1% AEP flood extents. No currently managed issues exist.</p> <p>Waingawa river bush RAP site [158] The RAP site sits within the erosion study area and is part of the buffer strip along this bank. It is also very close to the design channel alignment. No currently managed issues exist.</p> <p>MDC Water Treatment Plant – main facility [160] Parts of the water treatment plant sit within the erosion study area. No currently managed issues exist.</p> <p>House [163] A single dwelling sits within the modelled flood extent for the 1% AEP flood. No currently managed issues exist.</p> <p>House [164] A single dwelling sits within the erosion study area. This house is also within the existing Wairarapa Combined District Plan erosion area. It is not modelled to be affected by the 1% AEP flood extent. No currently managed issues exist.</p>	<p>Tararua drive stopbanks [168] The stopbanks in this location are of low level, and their crest height is frequently monitored.</p> <p>House [169] The house and outbuildings are within the erosion study area but sit outside the modelled 1% AEP flood extent. No currently managed issues exist.</p> <p>Distribution network powerlines [174] A pole which is part of the distribution network for local electricity sits in the active channel on the river bed. Adjacent pylons sit close to the river berms and are at risk of erosion.</p> <p>Road Bridge [183] The bed degradation is a managed problem in the area around the road bridge.</p> <p>Pumpstation for sewer pipeline [184] The sewer pipeline pump station is located within the erosion study area and on the edge of the 1% AEP flood extents. No currently managed issues exist.</p> <p>Channel alignment [181] The buffer zones on the true left bank between the two bridges are very narrow and have been recommended for review.</p>
HIGH	<p>Taratahi water race intake [156] Bed degradation in the vicinity of the water race has meant ongoing difficulties with maintaining water flow into the race. There is also a difficult balance to achieve between scour and aggradation effects due to the location of the intake in relation to the channel alignment.</p> <p>MDC water supply pipeline [157] Bed degradation at Black Creek is creating a risk to the Masterton Water Supply pipeline, which sits within the erosion study area.</p> <p>MDC water supply boost pump station [162] The boost pump station for the Masterton water supply sits within the 1% AEP flood extents. No currently managed issues exist.</p>	<p>Skeets stopbanks [171] The stopbank in this location cut off an historic overflow path that connected the Waingawa to the Waipoua River near Akura. It is a good quality stopbank maintained by GWRC but a failure could have flooding consequences for Masterton. High criticality.</p> <p>Stopbank [179] The stopbank on the true left bank between the two bridges is of very poor quality due to the mixing of wood mulch with the other materials used in its construction. It is believed to be of high failure risk and flooding through this area would affect the industrial yards further along the bank edge and along the fringes of Masterton. Material from this bank has been washed into the river in past events.</p>

Upper Plains – Reach 16

Response

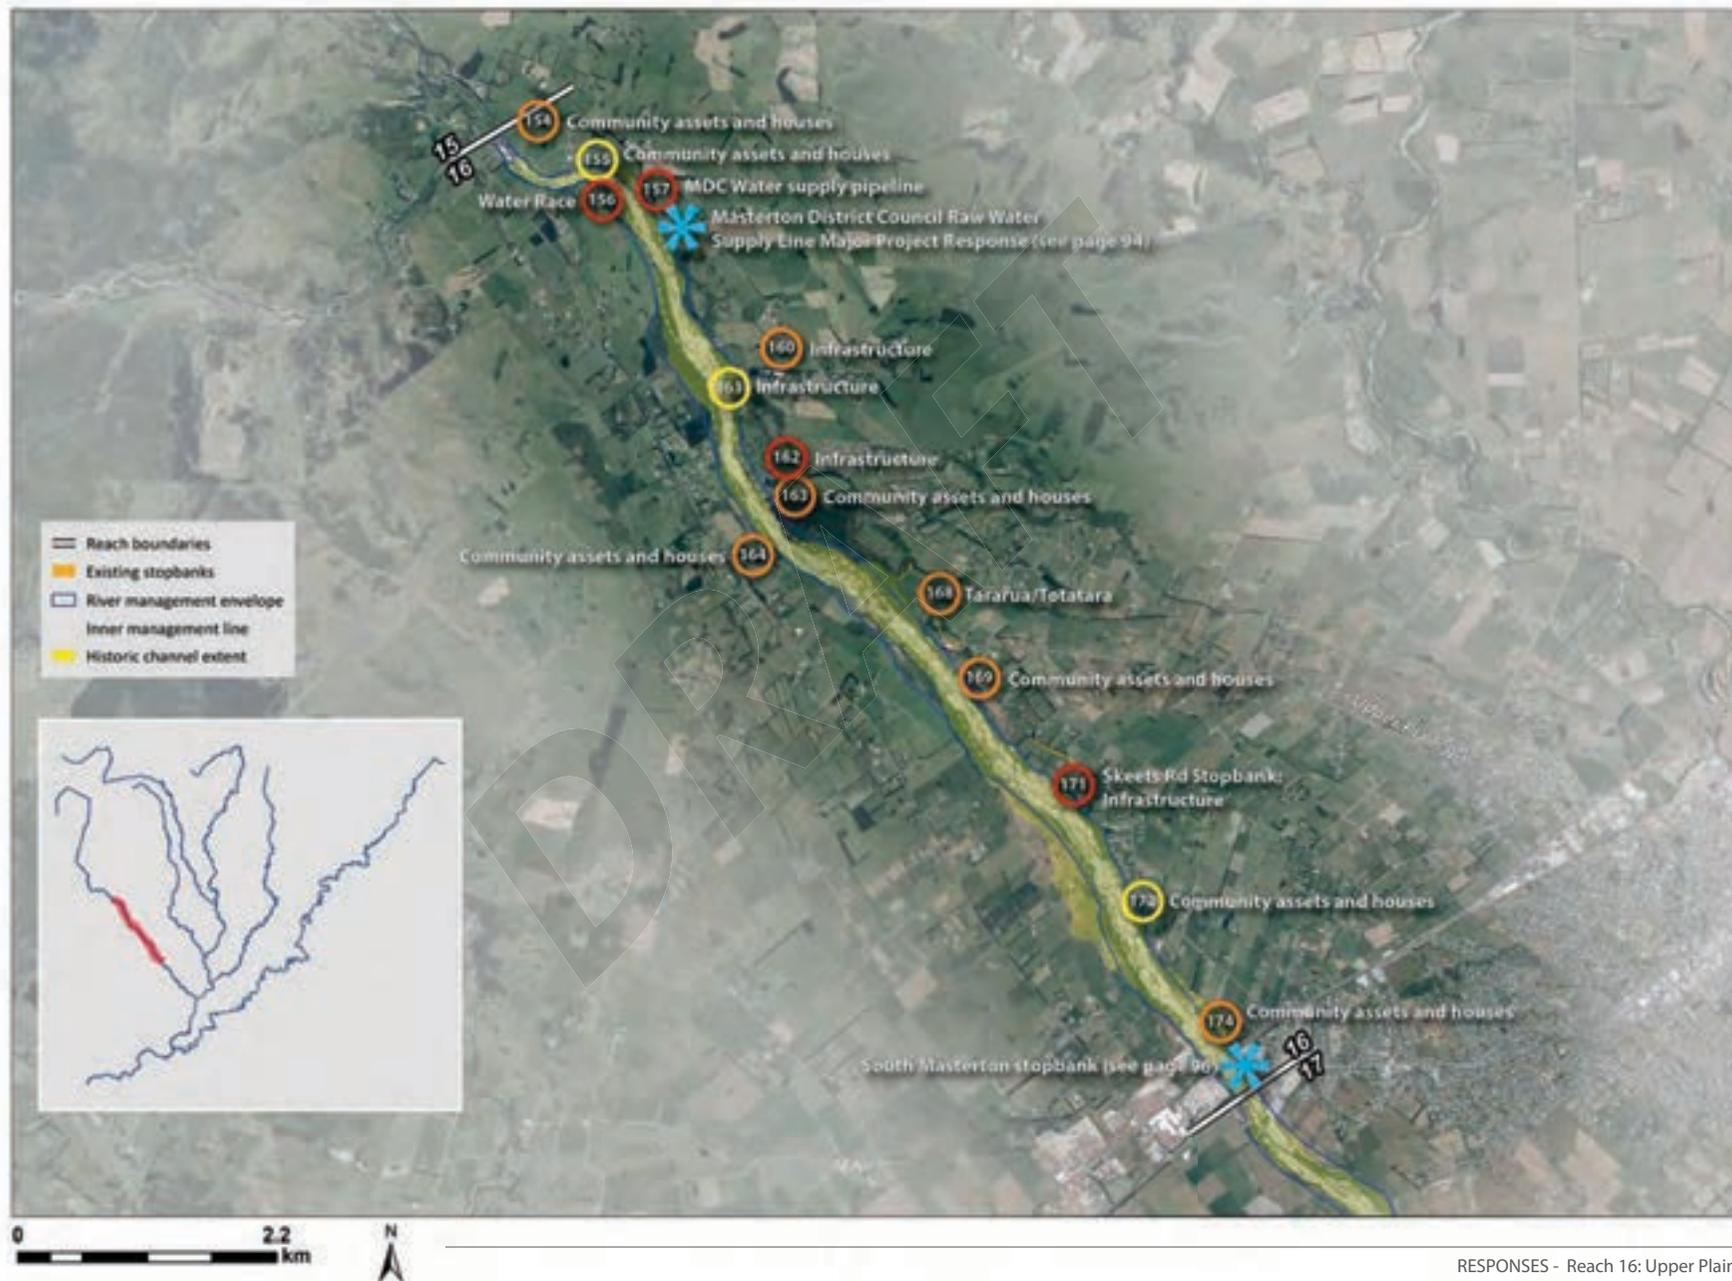

Common methods and specific responses that apply to this reach are set out below. The common methods used to address specific issues are listed in *Appendix 5*.

Reach Specific Responses

	ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES	LEVEL OF SERVICE (AEP)		RESPONSIBILITY		PRIORITY		
					CURRENT	TARGET	PRIMARY	SECONDARY			
SPECIFIC RESPONSES		Various sites	River management	Utilisation of river edge envelope common method. Establishment of successful buffer planting along the Waingawa is difficult in many places due to the high, steep sided and actively eroding banks. A key tool to enable buffer establishment is shallower profile banks which are then able to be planted to establish river edge vegetation. Shallower bank profiles will require the sacrifice of some buffer areas to the river to enable formation of more gentle slope gradients.	20%	5%	GWRC	Landowners	Medium		
	156	Water race	River management	Ongoing maintenance plan linked to bed level monitoring to maintain security of water race until replacement or retirement. Duplication and redundancy for Water Race intake through Water Wairarapa.				CDC	GWRC	Medium	
	157, 160, 161, 162	Infrastructure	River management	MDC responsible for contingency and repair plan to address the risk of loss of water supply infrastructure. MDC responsible for inspection of infrastructure attached to bridges to be undertaken after flood events. RESPONSES - Reach 16: Upper Plains

Major Project Response: Masterton District Council Raw Water Supply Pipeline

The issue

Masterton District Council abstract potable water from the Waingawa River through an intake structure and pipeline which feeds the water treatment plant located approximately 5km downstream. Following treatment, the potable water is then distributed throughout Masterton. The water supply intake is located on the right bank of the Waingawa River approximately 700m upstream of the Atiwhakatu confluence. Approximately 370m downstream of the intake, the pipeline crosses to the left bank of the Waingawa River. From this point the pipeline is in close proximity to the left bank of the Waingawa River in a number of locations (less than 20m in some areas) before it reaches the water treatment plant. Due to the close proximity and highly erosive nature of the Waingawa River, the pipeline is considered to be at risk from lateral bank erosion. It has been threatened and even exposed on a number of occasions in the past.

The past management regime has utilised a combination of boulder groynes (sourced from within the river) and channel alignment works (bed and beach recontouring) to provide a degree of protection. These maintenance activities are a short-term intervention which requires frequent renewal based on changes in river alignment and bank erosion during even relatively minor flood events.

The primary area of concern is at the Black Creek confluence. At this location the river transitions from the foothills of the Tararua Ranges out onto the alluvial floodplain and the reach character changes from a relatively confined narrow channel into a wider, more variable channel with a more semi braided morphology. The location most under threat is on the outside bend of a relatively tightly formed “S” bend. The river bed is naturally degrading (lowering) at this location which causes difficulties for Cateron District Council (CDC) in maintaining sufficient water levels in the river for water to flow into the Taratahi Water Race, which is located approximately 250 m upstream from the Black Creek confluence. CDC have constructed a boulder weir in the river to ensure water levels are high enough to act as a partial-weir and aid diversion of water into the water race. This weir has the potential to affect the river flow direction during floods by directing the main flow towards the left bank of the river and increasing the erosion potential on the outside of the bend at this location, where the water pipeline is in close proximity to the current river bank.

Opportunities

In the future there may be opportunities though the Wairarapa Water Use project to provide both municipal and water race water requirements via a dam proposed within the adjacent Black Creek catchment. This project is currently going through a feasibility assessment and therefore it is too early to be considered by the proposed project response in this FMP.

MDC have an emergency management plan to deal with any interruption to the supply of water to the treatment plant. There is sufficient storage in the water supply system to provide three days of potable water to Masterton. This provides sufficient time to enable deployment of a temporary pumping system directly from the river powered by diesel generators. Once this is set up it is possible to use this temporary system for as long as it takes to undertake the pipeline repairs and whatever emergency river works that are needed.

Relationship with common methods

River management envelopes exist and are utilised, although some modification of these lines may be necessary. Where the pipe alignment is within the identified buffer zone, an exemption from the general buffer approach is required to recognise the importance of the asset and the associated need for a higher level of service than a vegetative edge approach at these sites. The effectiveness of vegetated buffers in the steeper, incised upper reaches of the Waingawa River are also somewhat limited and the vegetation will typically only slow down the rate of erosion rather than preventing it all together.

Description

General

Response Option 1 (Structural)

To provide a higher level of security at the most at-risk site it is considered that a minimum of three rock groynes are required at the Black Creek confluence. See the plan on the next page for location and general arrangement.

Response Part 2 (Coordinated River Management and Emergency Management Planning)

This response will look to establish a Memorandum of Understanding between GWRC and MDC to enable the risks associated with the pipeline to be mitigated through a combination of Emergency Management Planning and River Management specific to the MDC Water Pipeline. This will establish a shared organisational understanding around annual level of service expectations implemented through the established river management scheme, and potential requirements in the event of an emergency situation whereby the pipeline was threatened or compromised by the effects of river erosion.

Costs

Part 1

Three Rock Groynes - up to \$300,000 based on each groyne being approximately 450 tonnes. This includes preliminary and general works, contingency of 30%, and design, consenting, and supervision.

Part 2

Approximately of \$5-20,000 per annum with an emergency funding allowance of around \$50,000 in the event of a significant flood event (river works only, excludes pipeline repair).

Implications

Implementation of Part 1 of the response will provide MDC with an increased level of security for their raw water main at the location identified as having the highest likelihood of failure. This will also reduce the cost of reactive maintenance requirements.

Implementation of Part 2 of the response provides for improved procedures to manage the risk associated with the pipeline and in the event of an emergency situation allows for incident recovery minimising any impacts on the community.

Both responses should include a management strategy for proactively working with CDC to ensure that the work carried out to the intake of the Taratahi Water Race minimises potential negative effects on the opposite bank adjacent to the MDC pipeline.

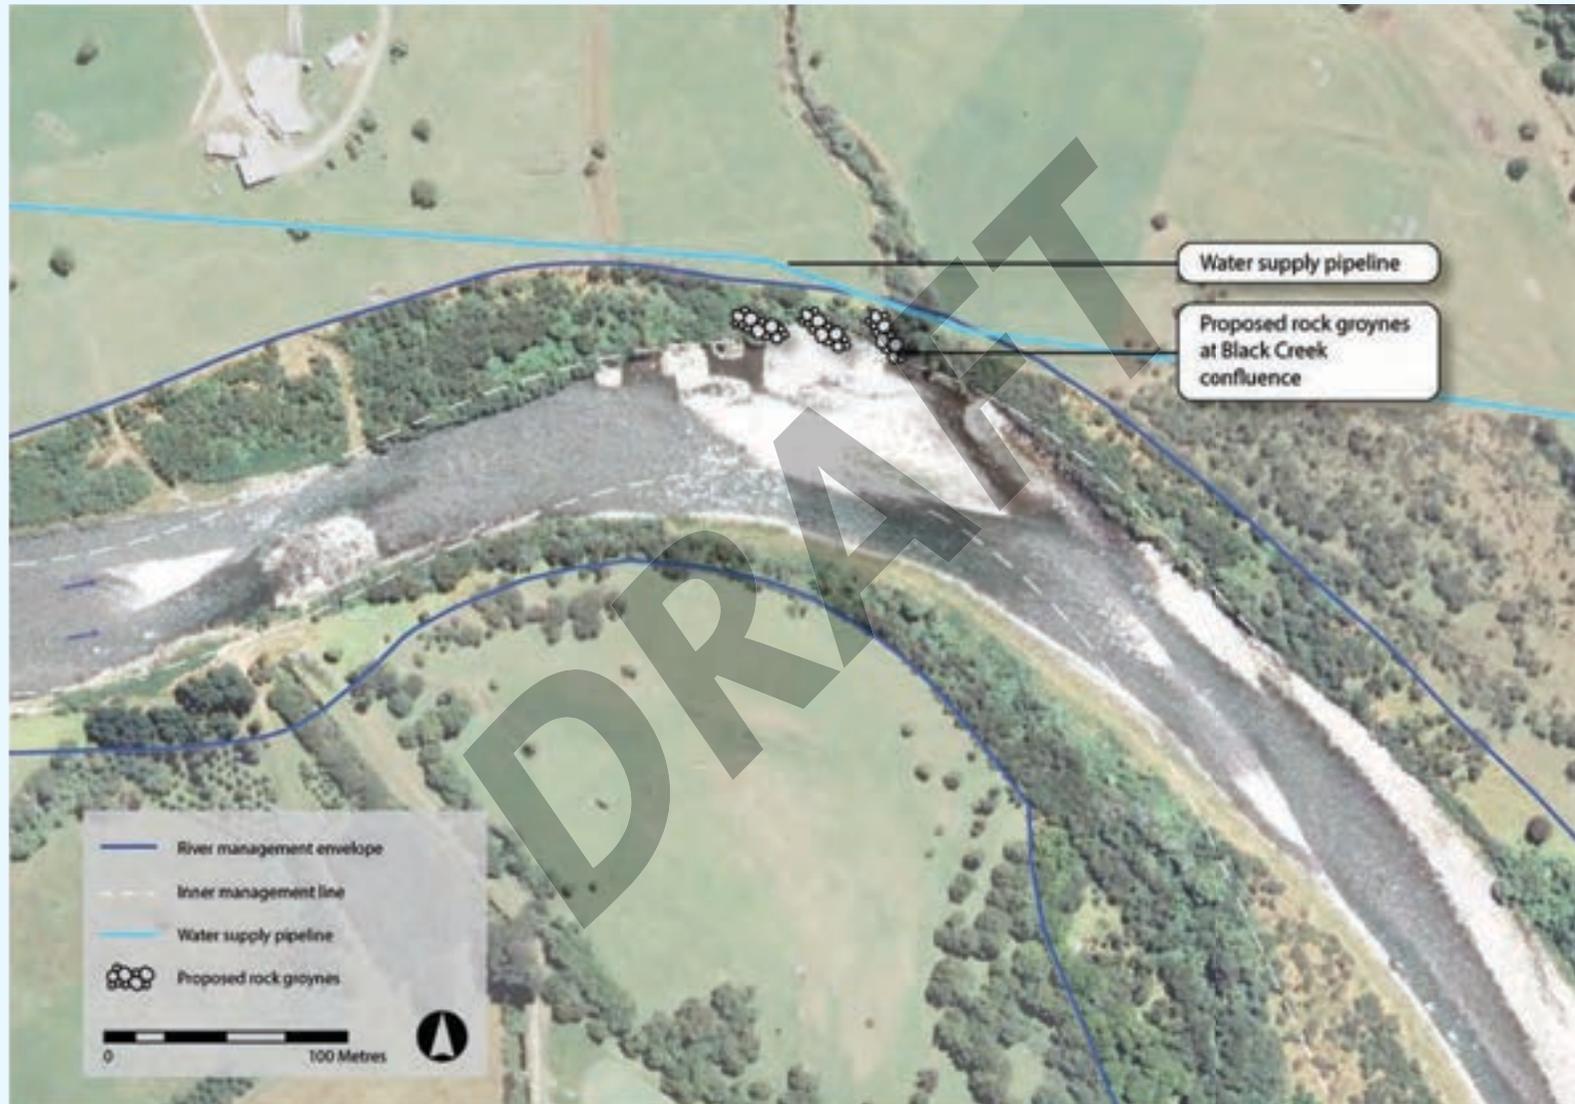

Priority

This response is classified high priority given the importance of the asset to be protected. Response Part 1 is considered low priority in the early years of FMP implementation but could be triggered following a changing cycle of flood events, GWRC/MDC agreement or a future FMP review. Response Part 2 is considered high priority.

Level of Service

Up to 1% AEP level of service, to be confirmed with MDC.

REFERENCE NUMBER	MANAGEMENT MEASURE	CURRENT LEVEL OF SERVICE	THREATS TO CURRENT LEVEL OF SERVICE	PROPOSED LEVEL OF SERVICE	PRIMARY REASON FOR RESPONSE	RESPONSIBILITY	PRIORITY	COST	FUNDING

Major Project Response: South Masterton Stopbank

The issue

There are a number of issues associated with the section of the Waingawa River between the rail bridge and SH2 bridge.

- The stopbank on the left (northeastern) side of the Waingawa River between the railway and SH2 bridges is located within the buffer and is at risk of erosion. This stopbank is also in relatively poor condition, although it has been assessed as “fit for purpose” as it is providing protection for a relatively small area of industrially zoned land and is therefore not considered to be a critical asset. It is at risk of failure in an extreme flood event.
- Managing the channel alignment through this reach is useful for reducing the scour risk at the rail and road bridges.
- The property on the immediate landward side of the stopbank has historically been used for timber treatment and is confirmed as being a contaminated site (SLUR – SN/06/141/02).

Opportunities

Improvements to the visual appearance, recreational opportunities, public access, and ecological value of the river margins on approach to Masterton from the south.

Relationship with common tools

The location of the stopbank within a buffer means that consideration needs to be given to retreating the stopbank to a less erosion prone location or abandoning/retiring the asset.

Description

General

The main risk to this reach of the river is lateral erosion of the river banks leading to erosion and failure of the left bank stopbank. The consequences of failure of the stopbank, in terms of flood inundation, are limited to a relatively isolated area of industrial land immediately adjacent to the stopbank. In addition to the consequences of inundation, there is also the potential for contaminated material to be eroded into the river or mobilised through groundwater flows.

The extent of contamination of the site and possible pathways for the contamination to mobilise into the surface or groundwater are currently unknown. A detailed site investigation is required to understand the extent and degree of contamination and the environmental risks this presents. This investigation would also include an assessment of options for containing or remediating the contaminants on the site. Remediation of the site could be done in conjunction with the retreat of the stopbank beyond the buffer.

This response will seek to maintain the status quo in terms of river management using the common methods to maintain the stopbank in its current position whilst the risks and mitigation options associated with the site contamination are investigated in parallel with consideration of retreating the stopbank.

Costs

Contaminated site investigation - \$100,000.

Further costs for remediation and retreat of the stopbank will be dependent on the outcomes of the contaminated site investigation.

Implications

There is a residual risk of failure of the stopbank or an over-design event that needs to be managed while the investigations are being undertaken. It is likely that this can be managed through appropriate flood warnings and education of the residents and businesses affected.

Priority

Medium priority to undertake the contaminated site investigation. Priority for future works would be dependent on the outcomes and risks identified in the contaminated site investigation but is unlikely to be more than medium unless serious contamination close to the river is identified.

Level of Service

The response provides the status quo in terms of the level of service as well as managing the residual risk through emergency management provisions. The longer term plan for the stopbank and the wider area can be developed once there is a better understanding of the site contamination and any remediation or containment requirements.

REFERENCE NUMBER	MANAGEMENT MEASURE	CURRENT LEVEL OF SERVICE	THREATS TO CURRENT LEVEL OF SERVICE	PROPOSED LEVEL OF SERVICE	PRIMARY REASON FOR RESPONSE	RESPONSIBILITY	PRIORITY	COST	FUNDING
179	Retreat existing stopbank to less erosion prone location outside the buffer.	2-10% AEP	Erosion by the river	5% AEP	Stopbank is non critical asset from flood hazard perspective but may be important for preventing contaminated material entering the river.	GWRC	Low	\$485,000	Capital funding TBC
179	Contaminated site assessment, visual improvements within the buffer, establishment of public access to the river	20-1% AEP	Erosion by the river	TBC	Appealing gateway to Masterton, recreational access and contaminated site management.	MDC/GWRC	Medium	\$100,000 for contaminated site assessment	Capital funding TBC

South Masterton – Reach 17

Character

The Waingawa River continues a twisted semi-braided form to the east of the State Highway 2 Bridge. The margins of the river corridor are more consistently established in willows, separating the river from adjoining areas of pasture and cropland. Hood Aerodrome, urban edge development and gravel extraction also influence the character of the river. In other areas, the river retains a varied and dynamic semi-braided form.

Key Characteristics

Broad semi-braided form

Consistent willow planting along margins

Key Floodplain Management Points

- This FMP will shift the focus of river maintenance towards more intensive implementation of vegetated buffers. The design buffers will be allowed to erode when and where appropriate. This method will substitute the immediate response to erosion issues with the machinery in channel works practiced in the past
- This FMP will increase river enhancement works.
- Work with the owners of Hood Aerodrome to maintain the operation and security of their facility
- Work with MDC and CDC to address the dumping of rubbish that occurs at access points along this reach
- Continue to develop land access and retirement agreements to widen the river corridor
- Recreation management to encourage good quality recreation opportunities

Values

The close proximity of the southern end of Masterton together with gravel extraction visible from State Highway 2 Bridge frequently detracts from natural values associated with the river. Overall this results in a perceived medium / high level of landscape modification with medium scenic values retained along the wider reach.

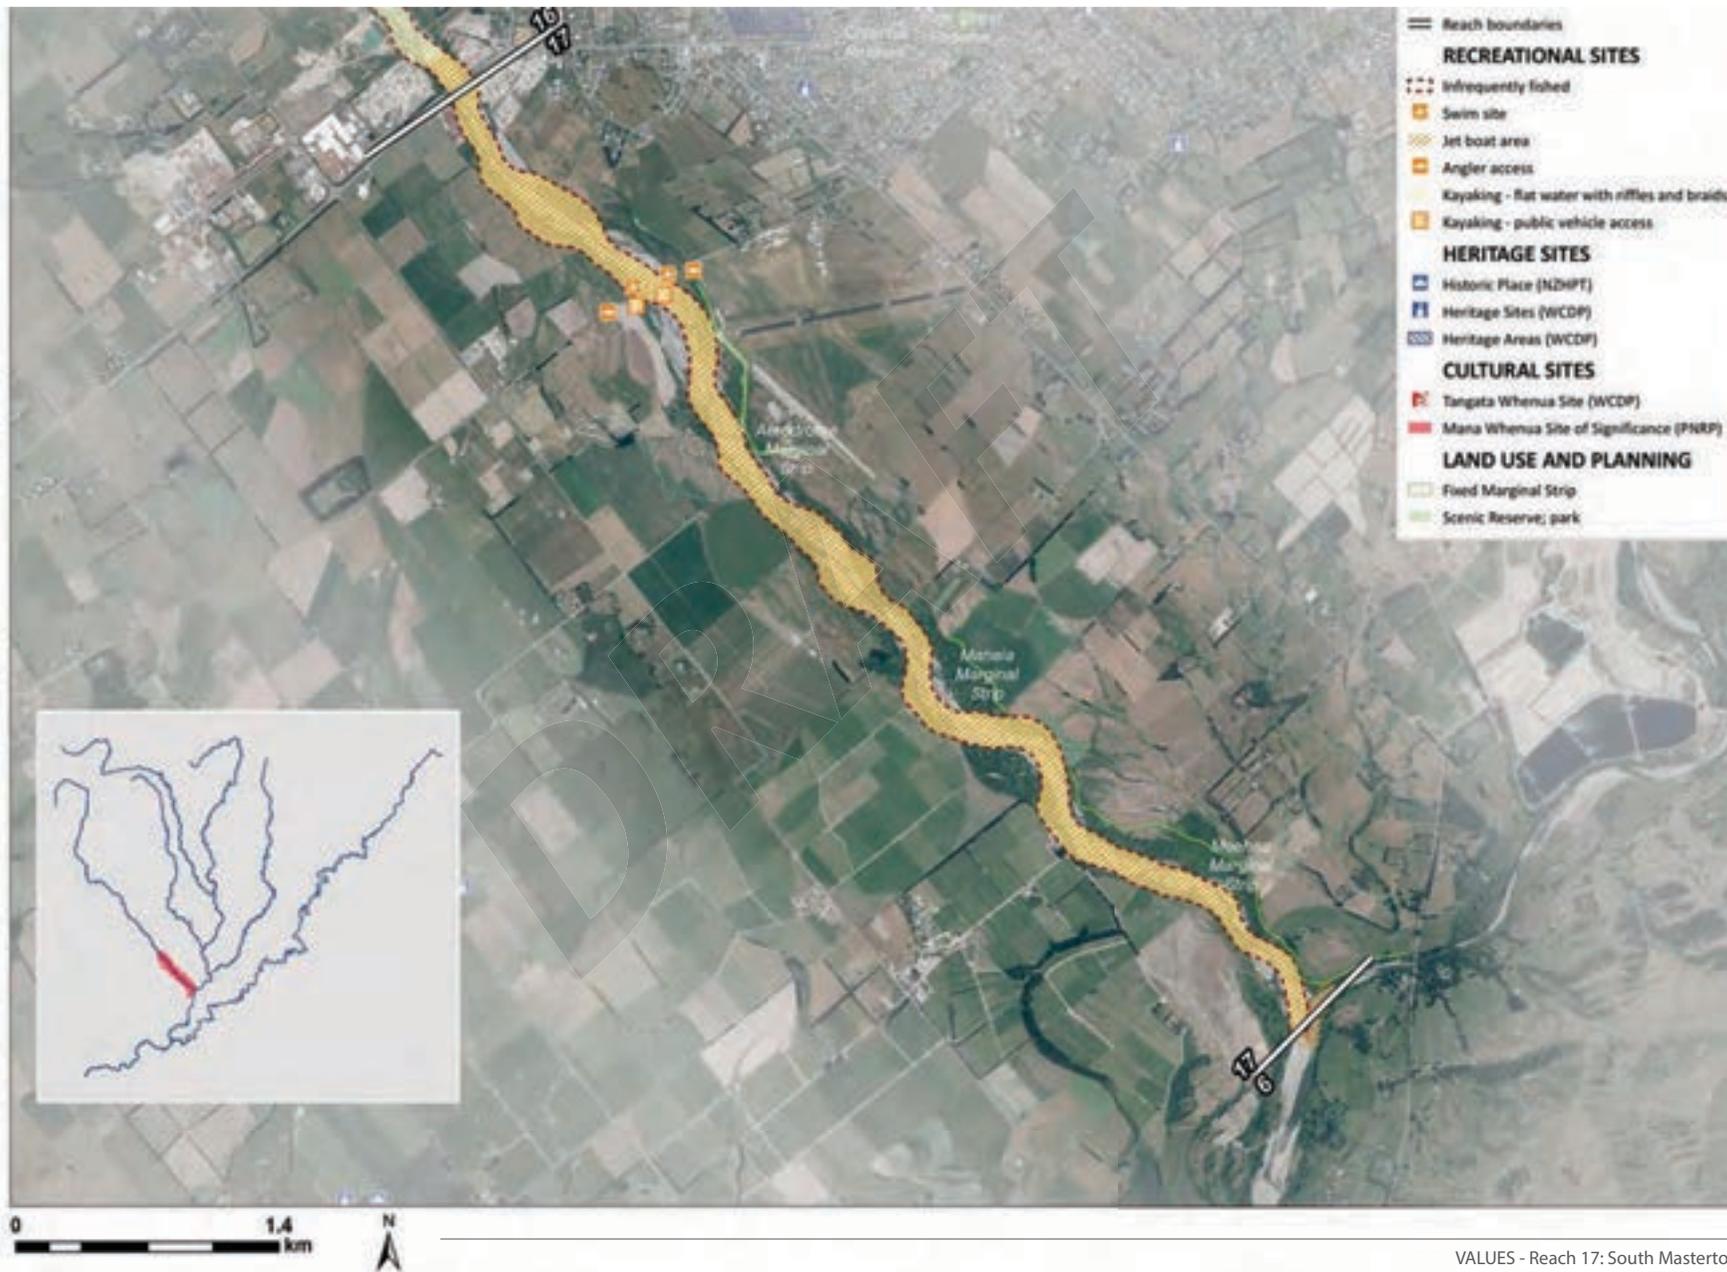

Some kayaking occurs along this reach on account of the continuation of flat water with riffles and braids flowing from the upper reaches of the river. State Highway 2 Road Bridge also forms the upper limit of jet boating typically encountered along the Waingawa.

Fishing remains infrequent throughout this reach because of the changing course of the river. Whilst fish passage remains important, the form of the river remains unstable and does not typically hold fish within it. Popular swimming sites are identified at South Road and Hughes Line on each side of the river immediately above Hood Aerodrome.

Terrestrial habitats with identified ecological values along this reach include mixed exotic-indigenous forest, indigenous treeland, stonefield and boulderfield, natural wetlands and ponds.

Wetlands along the margins of the Waingawa River were important for gathering mahinga kai, with cultural sites also associated with the mixing of mauri as water flows into the Ruamāhanga at the bottom end of this reach.

LANDSCAPE VALUES		RECREATION VALUES	HERITAGE VALUES	CULTURAL VALUES	LAND USE AND PLANNING	ECOLOGICAL VALUES
LANDSCAPE MODIFICATION	SCENIC VALUE					
Medium / High	Medium	Angler access, kayak access, kayaking, jet boating, swimming, infrequent fishing	-	Mixing of mauri	Rural (Primary Production), Rural (Special), Road, River, Industrial, State Highway, Aerodrome and Recreation Purposes.	Mixed exotic-indigenous forest, Indigenous treeland, Stonefield and boulderfield, Natural wetlands and ponds

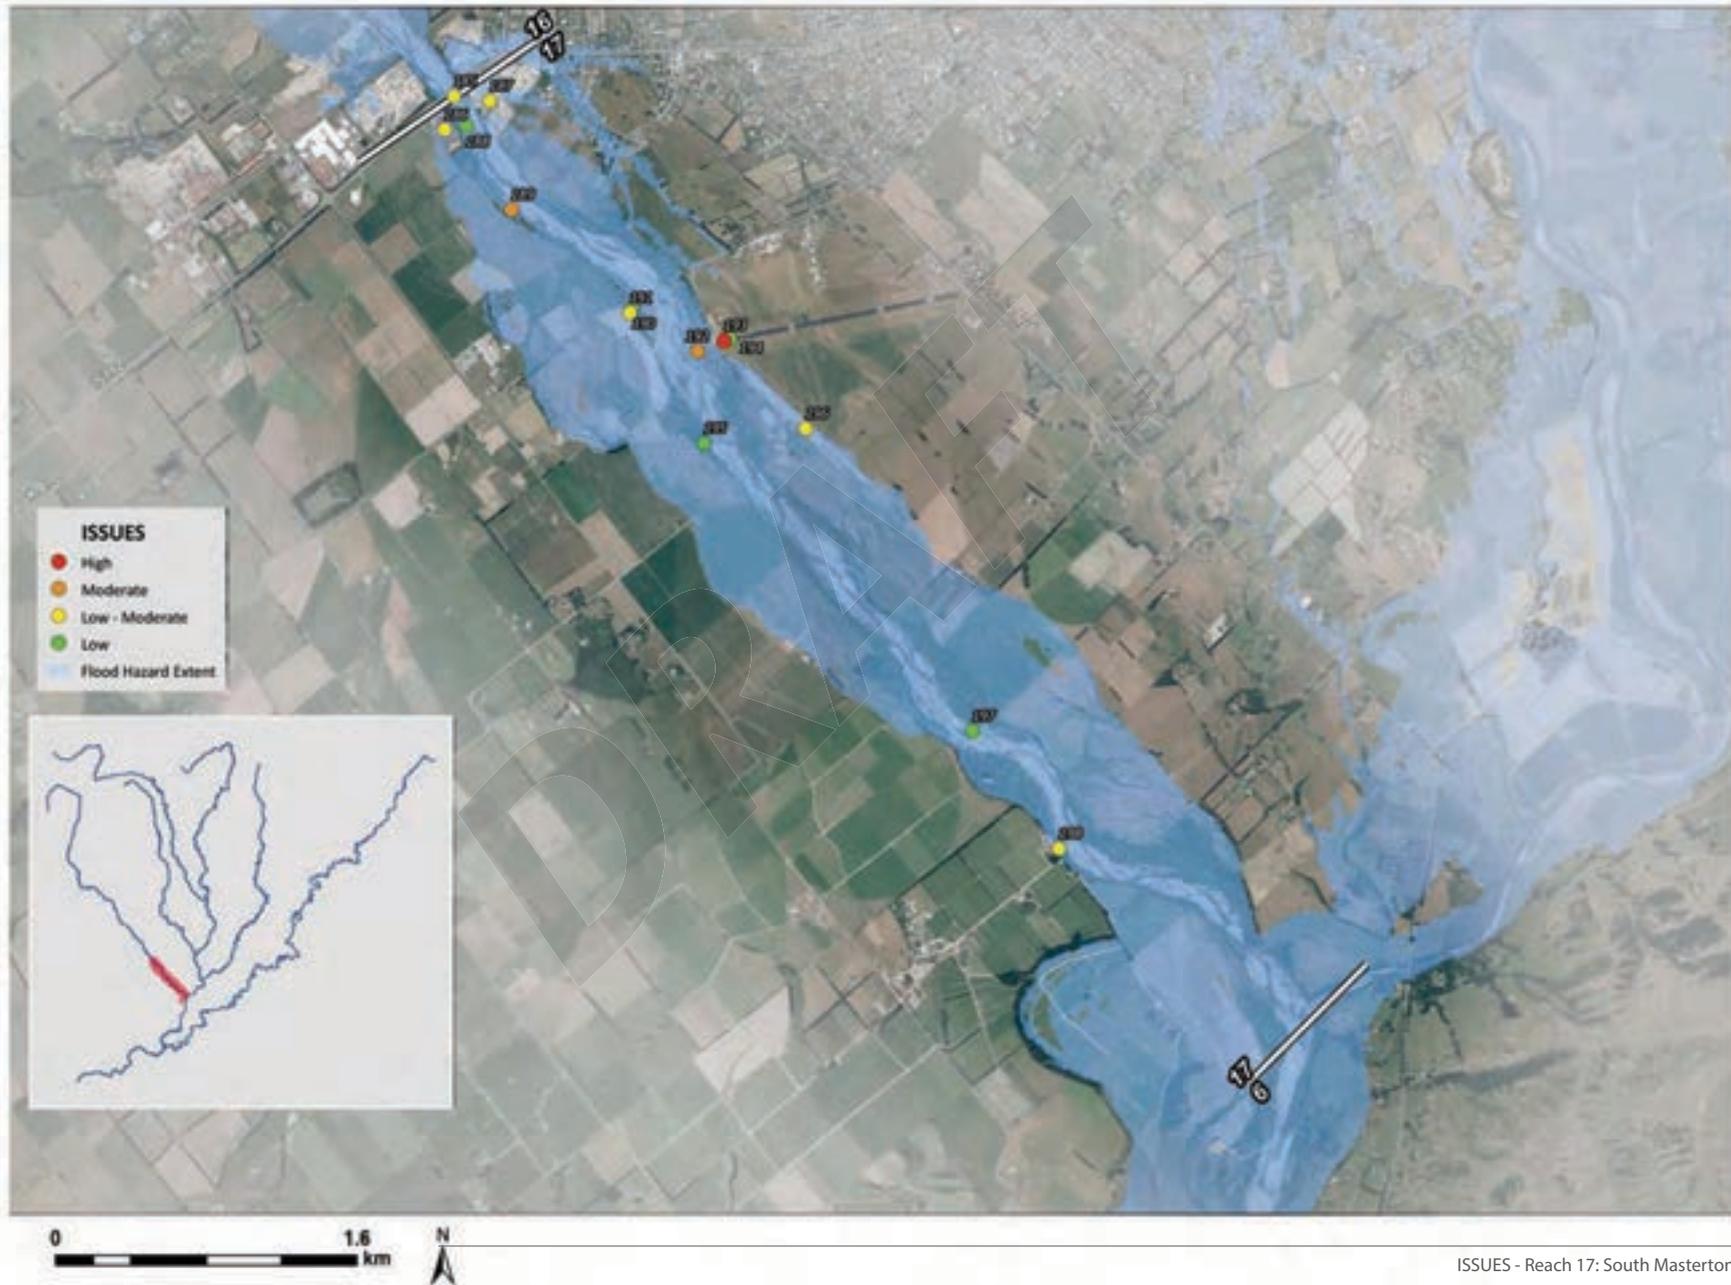

VALUES - Reach 17: South Masterton

South Masterton – Reach 17

Flood and erosion issues

A total of 13 erosion and flood management issues are identified along this reach. Issues have been ranked according to their consequence and likelihood (i.e. risk) and assigned an ID number [xx].

LOW	<p>Powerlines [188] Distribution network powerline pylons are located within the erosion study area 30m downstream of SH2. No currently managed issues exist.</p> <p>Illegal dumping site [190] This recreation access site is affected by illegal dumping of rubbish.</p> <p>SLUR site [194] The aerodrome is a registered SLUR site which sits within the erosion study area</p>	<p>Water intake [195] There is a private water intake structure located within the erosion study area. It is not known to have any issues.</p> <p>Distribution network [197] The pylon on the true right bank sits within the erosion study area, the true left bank is believed to be outside of the erosion study area extents. No currently managed issues exist.</p>
	<p>Powerlines [185] Transmission network power line pylons are located within erosion study area. No currently managed issues exist.</p> <p>Contractor's yards [186, 187] Contractor's yards are located within the erosion study area and 1% AEP flood risk. Erosion management is an ongoing issue at this location.</p> <p>Recreation area [191] The good access to the end of Hughes Line makes it a popular area for recreation groups. There is interest in developing this access and area further from a number of interest groups.</p>	<p>Drag strip [196] The Masterton drag strip is located within the erosion study area and is affected by the modelled 1% AEP flood. No currently managed issues exist.</p> <p>Private water intake [198] A private water intake is located within the erosion study area. No currently managed issues exist.</p>
	<p>Land retirement agreements [189] Land use changes are currently underway in this area to increase the amount of buffer strip available to manage riverbank erosion.</p> <p>Flight path [192] Tree height has a controlled level for aircraft taking off from the aerodrome.</p>	
HIGH	<p>Aerodrome runway [193] The aerodrome runway is known to be affected by erosion and has been eroded in recent past (2000). Situated within the erosion study area.</p>	

South Masterton – Reach 17

Response

Common methods and specific responses that apply to this reach are set out below. The common methods used to address specific issues are listed in *Appendix 5*.

	ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES	LEVEL OF SERVICE (AEP)		RESPONSIBILITY		PRIORITY
					CURRENT	TARGET	PRIMARY	SECONDARY	
SPECIFIC RESPONSES		Various sites	River management	Utilisation of river edge envelope common method. Buffer plantings within the Waingawa River are challenging in many places. A key tool to their establishment is the erosion of banks to create shallower profile banks which are then able to be planted to establish river edge vegetation. Shallower bank profiles will require the sacrifice of some buffer areas to the river.	20%	5%	GWRC	Landowners	Medium
	192	Flight path	River management	Maintain tree height within the buffer zone and under the flight path restrictions.			GWRC	MDC	High
	191 190	Recreational access sites	Environmental Enhancement	Develop and formalise access points on true right and left banks, establish care groups to manage these areas.			Community	GWRC	Medium
		Three Rivers Trail	Environmental Enhancement	As part of the Environmental Strategy, establish Three Rivers Trail to link Masterton to the Waingawa, Ruamahanga, and Waipoua Rivers. Incorporate as part of larger Trails Wairarapa projects/initiatives. Link to tourism Wairarapa.			Community	GWRC	Medium
COMMON METHODS		Entire reach	River management	River edge envelope, river bed level monitoring, recognition of buffers as a river management tool, pool-riffle-run envelope, historic channel lines, isolated works support, Code of Practice, mixed vegetation planting, alternative land uses within planted buffers					
		Entire reach	Planning and policy	Land use controls, flood hazard maps, rural stopbank policy, scheme decision policy, abandonment/retirement of assets, land access & strategic land purchase					
		Entire reach	Emergency management	Emergency management planning, community resilience, flood forecasting and warning system					
		Entire reach	Environmental Enhancement	Environmental strategy, Community Support Officer, care group and clubs					

RESPONSES - Reach 17: South Masterton

Major Project Response: Hood Aerodrome

The issue

The runway for the Hood Aerodrome has been continually affected by erosion and was close to getting washed away during a flood in 2000 (see photograph on the right side). Four rock groynes constructed following this flood provide some degree of protection but are at risk of being outflanked from upstream. A number of small floods in 2015 and in early 2016 caused erosion to occur upstream of the runway. In response to this 1100 willow poles were planted in June 2016 along with some minor in-channel works in an attempt to realign the river to its desired design alignment and establish a vegetated buffer. In a steep, dynamic river, such as the Waingawa, willow protection works are only able to slow down the rate of erosion and will not be capable of completely preventing it. If a greater level of security to the runway is desired then a rock line is required from the terrace to tie in with the upstream rock groyne. The rock line would be 140 m long and would act in part as a deflector groyne to direct the main flow away from the runway.

Opportunities

This response provides a higher degree of security to the runway, which would be of particular importance if commercial flights are re-established from the site. It also avoids the risk associated with potentially contaminated land (Selected Land Use Register SN/06/004/02 Manawatu Aerial Topdressing, Category I) being eroded into the river.

Relationship with common methods

The current management of this reach using willows combined with in-channel works is aligned with the common methods of recognition of buffers as a river management tool and the Code of Practice. This response and its use of a rock line/training groyne is a standard response provided for in the Code of Practice.

Description

General

A 140 m long rock line extending from the terrace to the existing upstream rock groyne.

Costs

\$755,000 (3,650 t rock @ \$130/t (placed with geotextile) \$474,000 + \$29,000 Preliminary and general, 30% Contingency, 20% Design, consenting, and supervision.)

Implications

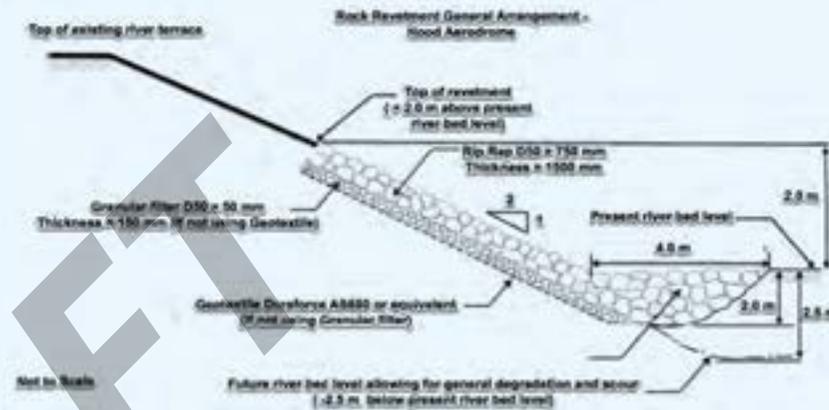

Possibly diverts erosion issue to opposite side of river by providing hard point on left bank.

Priority

Currently a low priority but if a new commercial operator is found for the aerodrome then this could change.

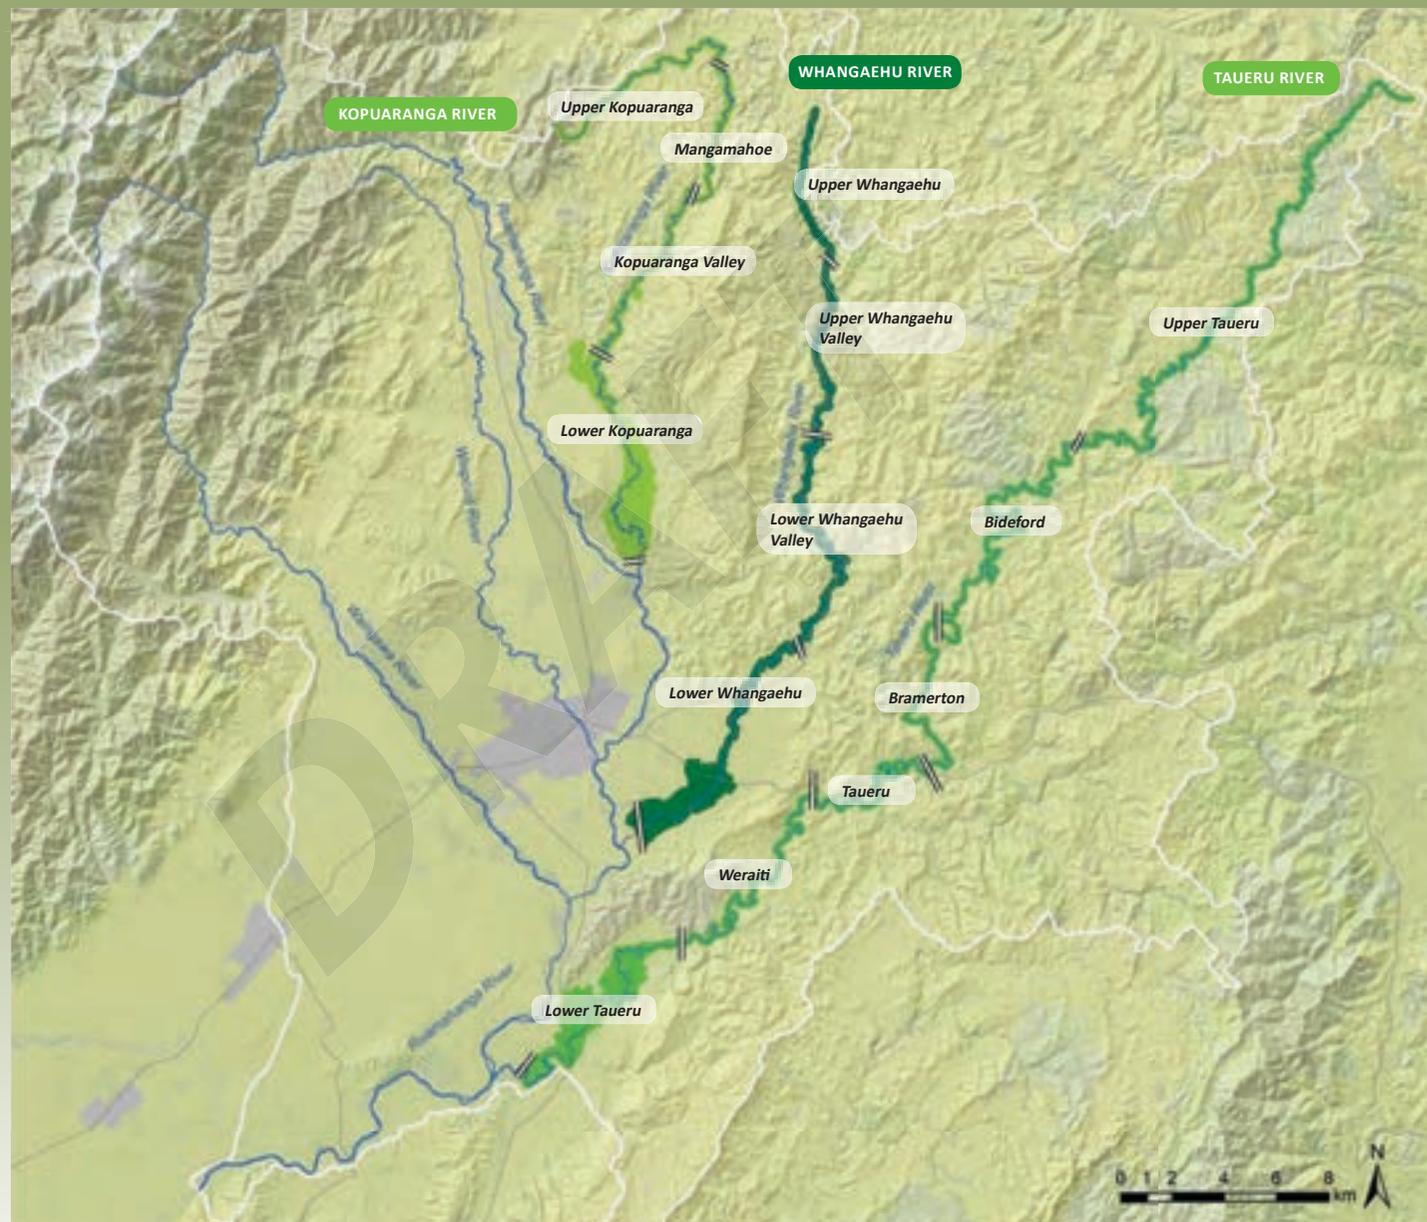

Level of Service

Up to 2% AEP level of service to be confirmed in discussion with MDC and potential commercial operator for aerodrome.

REFERENCE NUMBER	MANAGEMENT MEASURE	CURRENT LEVEL OF SERVICE	THREATS TO CURRENT LEVEL OF SERVICE	PROPOSED LEVEL OF SERVICE	PRIMARY REASON FOR RESPONSE	RESPONSIBILITY	PRIORITY	COST	FUNDING
ID 192, 193 and 194	Rock line connecting terrace with existing rock groyne at the end of the runway	Low	Erosion by the river	2% AEP	To increase protection to the runway and avoid any contaminated material being eroded into the river.	MDC/GWRC	Low	\$755,000	Capital funding TBC

Eastern Rivers

9. Eastern Rivers

The Kopuaranga, Whangaehu and Taueru (Tauweru) Rivers have been grouped together as the Eastern Rivers. Their character, values, and flood and erosion issues are broadly similar, as are the management objectives and techniques used.

The floodplains of the Eastern Rivers are relatively sparsely populated, although this is increasing with lifestyle block development in the lower reaches, particularly on the Kopuaranga and Whangaehu Rivers in areas closer to Masterton. This is having an impact on informal access arrangements to recreational and cultural sites. Mauriceville, on the Kopuaranga River, is the largest settlement.

The rivers are generally considered to have low to medium levels of landscape modification, tending towards higher levels of modification in the lower reaches. The three rivers have low/medium levels of scenic value in their lower reaches, with areas of medium/high scenic value tending to occur in the upper reaches (and coinciding with less modified reaches). In many areas, willow trees dominate the channel form. In the reaches where current scheme maintenance is taking place, crack willow infestation has been controlled. Elsewhere crack willow infestation is a big problem due to the channel constriction it causes.

Land-use in the catchments is predominantly primary production activities (dairying, dry stock grazing, cropping, and plantation forestry) with a few scattered areas of native forest. There is little evidence of lifestyle type development in the upper catchments.

All three rivers are used for game bird hunting and fishing. The Kopuaranga River is the most fished of the three. The lower Taueru River is used for kayaking. A number of informal access arrangements are in place for recreational access.

Several cultural value sites occur throughout the Eastern Rivers. This includes Kopuaranga settlement and Kohekutu Pā along the Kopuaranga River, and multiple pā and urupa along the Taueru River. Whilst there are no specific sites recorded on the Whangaehu River, this is known to be very significant to local Maori, containing many waahi tapu areas and important spiritual connection with Rangitumau.

The Kopuaranga and Taueru Rivers were important travel routes for Maori travelling north and north-east respectively. As a result, these two rivers have mahinga kai values in their channels and surrounding forested areas. In particular, the upper Taueru River is noted for freshwater crayfish and the lower Taueru River for eels. This eel fishery remains important.

There is limited ecological information on the Eastern Rivers in relation to the abundance of birdlife and fish species. There are a number of areas of habitat value, such as natural ponds/wetlands and patches of indigenous forest (both fenced and unfenced). The lower Taueru River also contains the Te Kopi Road and Peters Bush RAPs.

General Issues

- Flooding of large areas of farmland (entire valley floors) and access routes cut off
- Lifestyle block development near Masterton
- Potential for greater erosion/changes in channel form in the future as a consequence of willow removal

Kopuaranga River

Character and Values

The Kopuaranga River flows into the Ruamāhanga River to the north of Masterton. The headwaters originate in the northern Wairarapa hill country to the east of Mount Bruce. The main river channel from its headwaters to its confluence with the Ruamāhanga River is 58 km in length.

The Kopuaranga River has a number of small tributaries. The main channel flows on a northeast course from its source in Mount Bruce to Hastwell, where it crosses a relatively wide valley before turning south. The river then flows south within a narrow valley, following the line of the West Wairarapa fault. In its lower reaches the river turns away from the fault line and follows an old course of the Ruamāhanga River, joining the Ruamāhanga River east of Opaki.

The name Kopuaranga means fish in a deep or dark pool, and the river has long been associated with fishing.

In its upper reaches across the Hastwell's Valley, the river channel is characterised as an entrenched channel. The river then flows within a narrow fault-formed valley in a tightly meandering channel. On its lower reaches, the river channel becomes wider and straighter, with sections of tighter meandering channels.

The Kopuaranga floodplain contains a mix of soils formed from sandstone, limestone and siltstone. Vast tracts of the fertile Kopuaranga river deposits were used as gardens for centuries. Land use in the catchment is now predominantly in primary production activities (dairying, dry stock grazing, cropping and plantation forestry) with a few scattered areas of native forest throughout the catchment.

In terms of recreation values, the Kopuaranga River is popular for fishing and game bird hunting, and in some areas this has led to enhancement of natural wetlands and ponds, improving the ecological value of the river.

Two cultural sites have been identified along the Kopuaranga River, these being Kopuaranga settlement, and Kohekutu Pā. However the river used to form part of a northwards travel corridor and it has value for mahinga kai, related to both the river and the surrounding forested area.

Key Floodplain Management Points

This FMP provides a framework to supply erosion control works at priority locations, increase planting for erosion control and river enhancement, and other limited noxious plant control works which are included into river maintenance activities. An extension of the scheme boundary further upstream for 24 km from Clarke Domain will be implemented.

Key characteristics by reach:

Upper Kopuaranga

Small stream corridor through rolling pastoral landscape

Grass banks with bank slumping in areas

Mangamahoe

Enclosed valley landform containing road and rail corridor

Tightly meandering willow choked corridor

Flax and cabbage tree planting reintroduced in some low-lying areas

Kopuaranga Valley

Meandering river corridor along semi-enclosed valley landform

Increasing rural lifestyle development along river margin

Mixed willow, exotic planting and grass margins

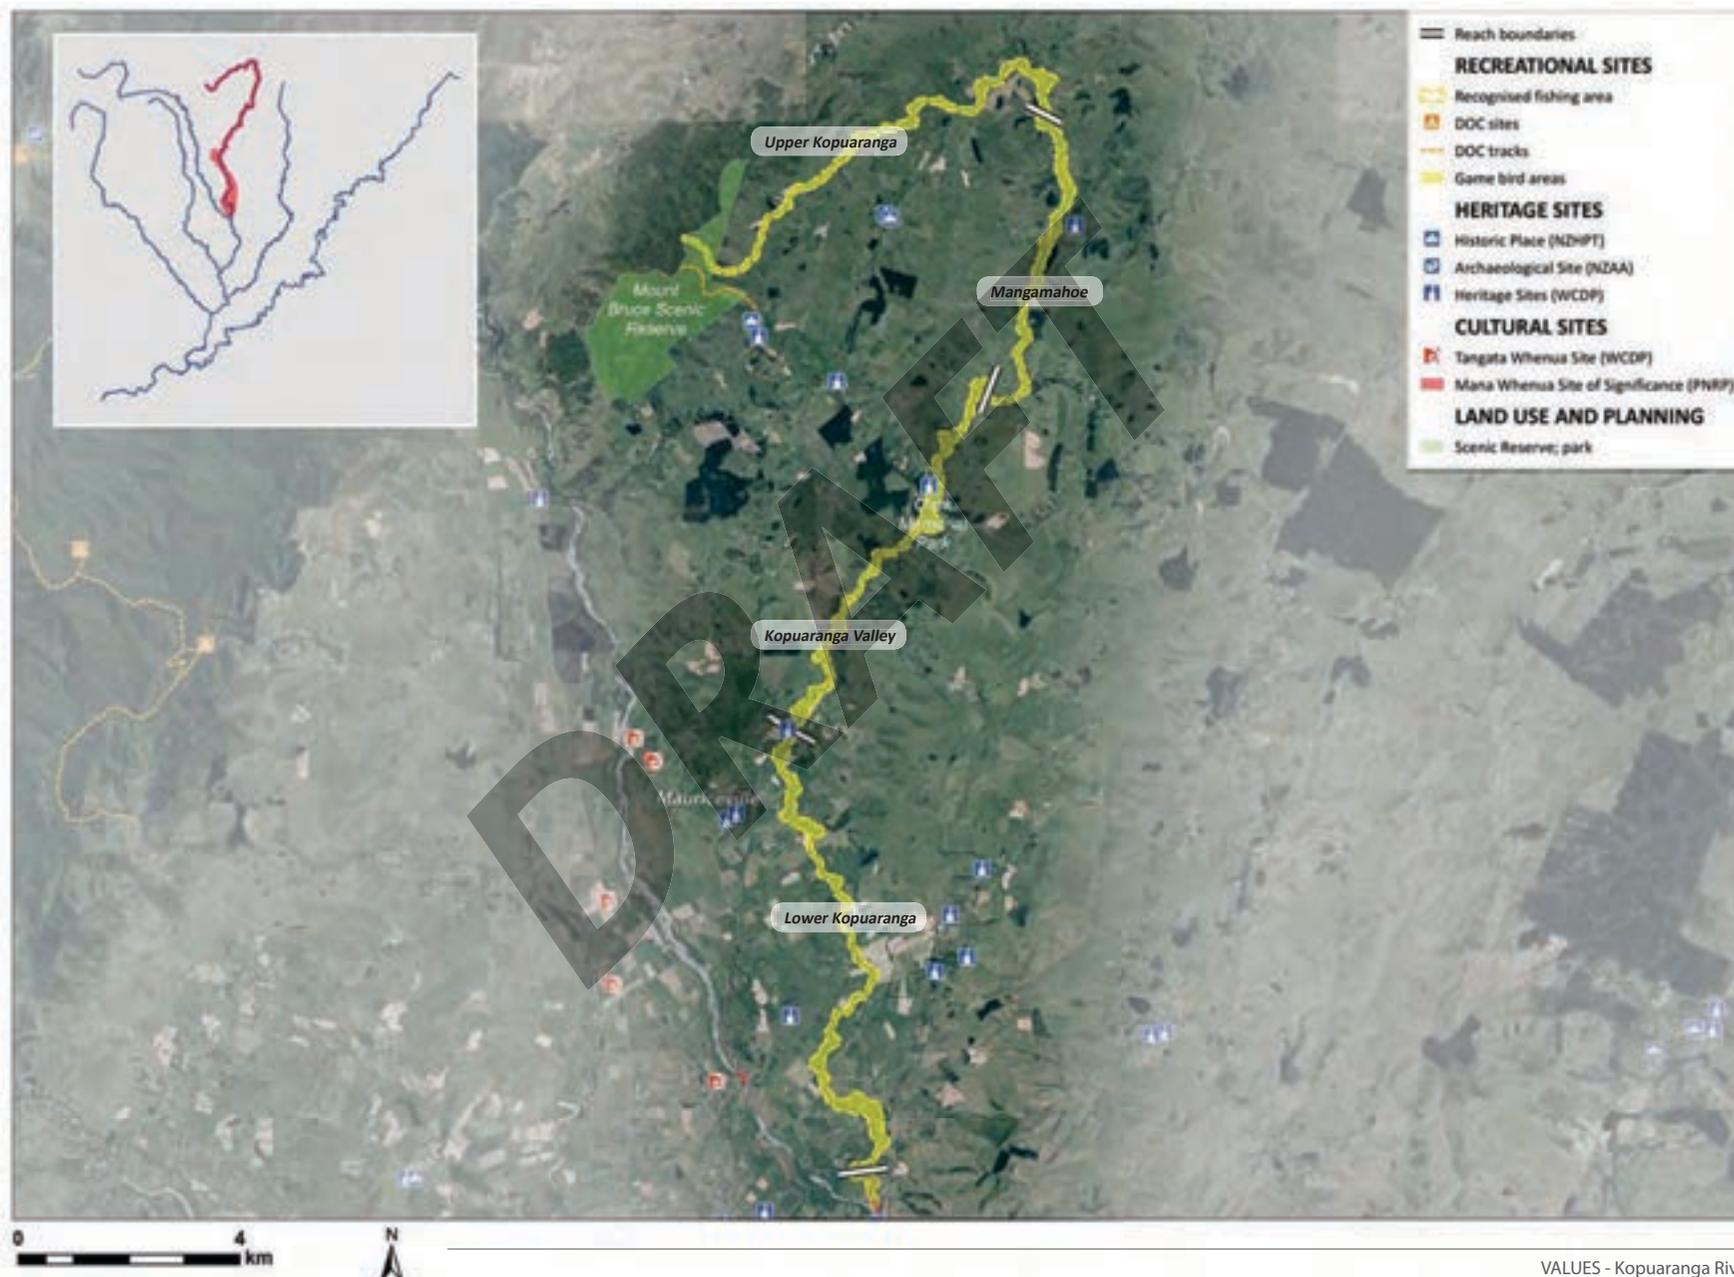

Lower Kopuaranga

Meandering course along eastern edge of Wairarapa Plain

Sparsely settled farmed margins

Mixed poplar, willow and conifer margins

VALUES - Kopuaranga River

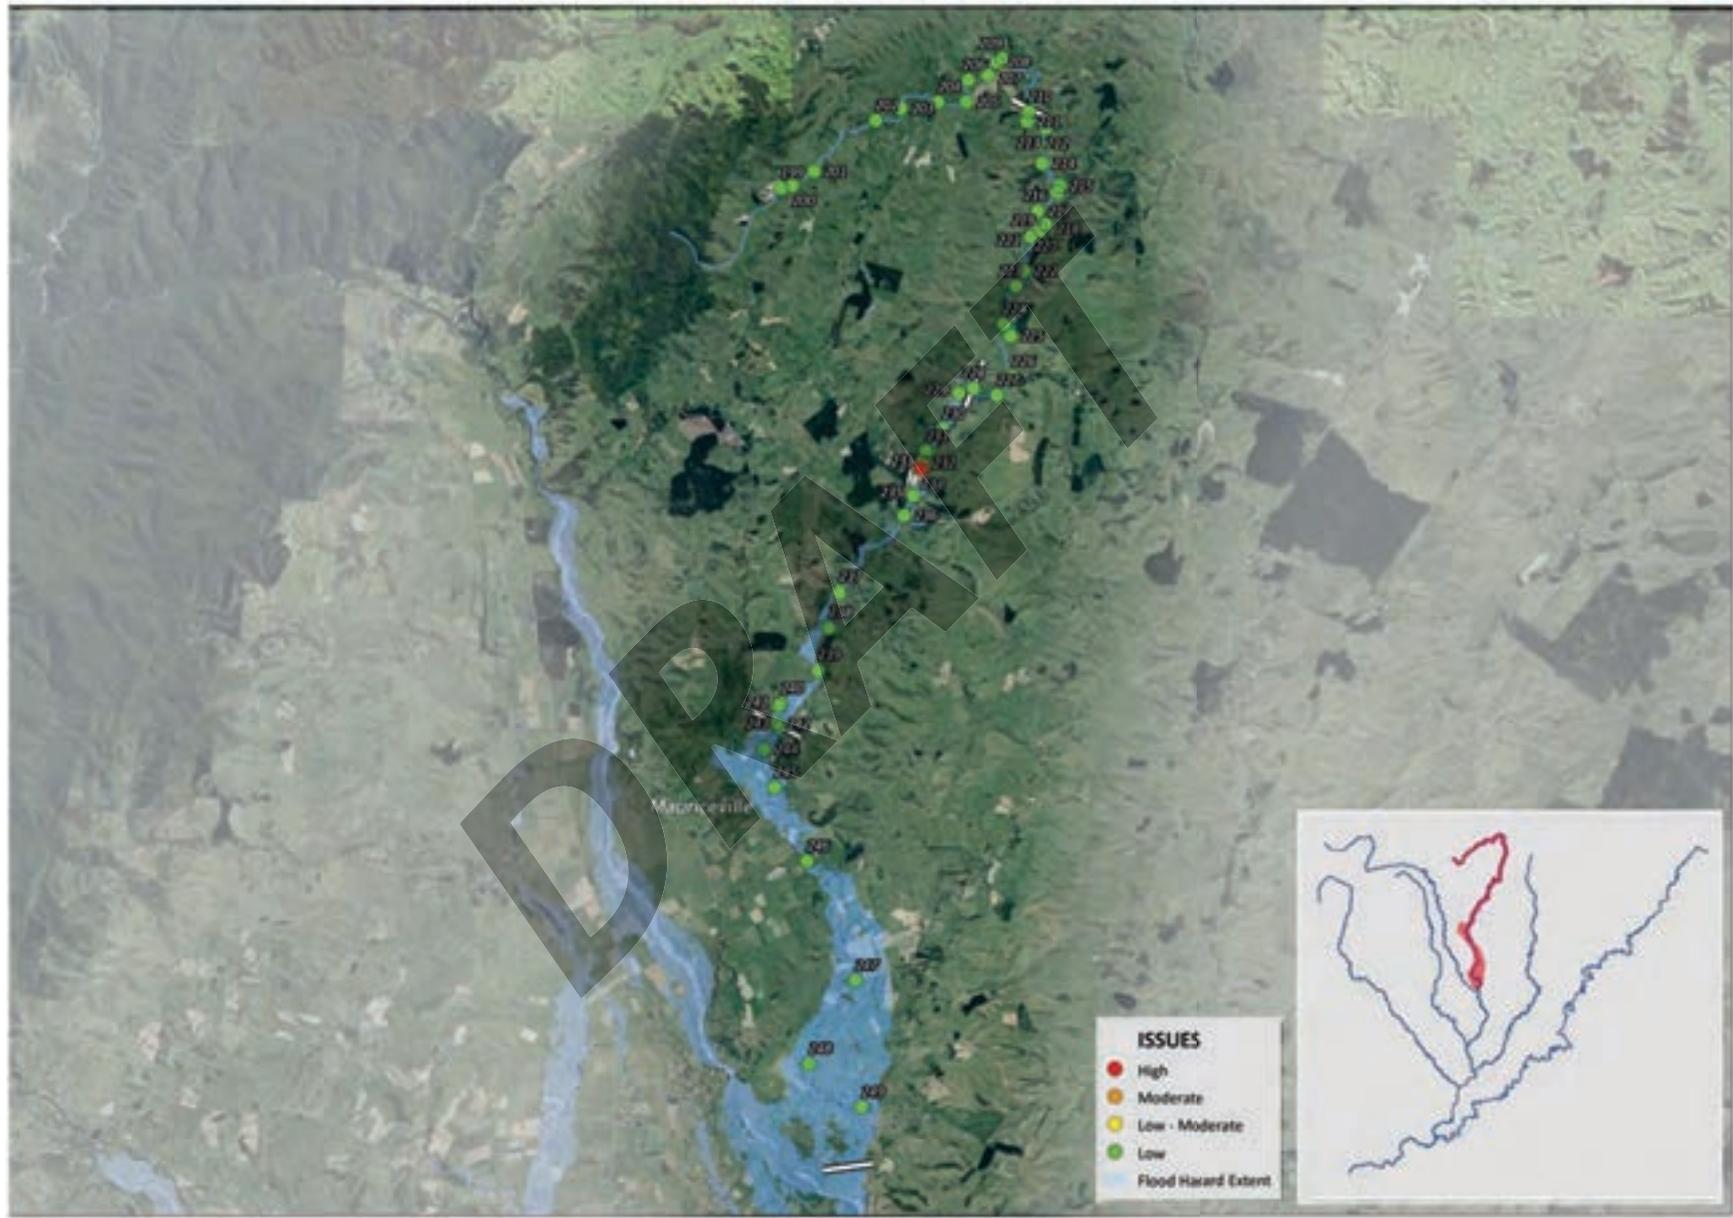

Kopuaranga River

Issues

The Kopuaranga River is prone to overtopping the banks of its incised (deeply cut) channel and spilling out onto the floodplain, even in relatively small flood events. This combined with a channel choked with willows may lead to extensive flooding across the plains affecting farms, homes and a number of rural roads.

There is minimal erosion risk posed by the Kopuaranga River, although there are concerns regarding silts washed from the banks and into the stream from its upper reaches. In its lower reaches it sits within a remnant overflow path of the Ruamahanga River. A number of rural assets, structures, farm tracks and buildings have been included in the erosion hazard study area.

Whangaehu River

The Whangaehu River extends from the northern area of the Upper Wairarapa to the Ruamāhanga to the south-east of Masterton. The altitude of the Whangaehu catchment ranges from approximately 410 metres in the headwaters to around 90-95 metres at the lower end of the Te Ore Ore plains.

The upper reaches of the river flow from steep hill country near Ihuraua, and the river flows for some 32 kilometres to the Ruamāhanga River. It flows due south in the middle of a long rectangular catchment following the line of the ancient Alfredton fault. The steep catchment sides contain the river in a narrow valley in this area. In the lower reaches it meanders across the Te Ore Ore plains east of Masterton.

Formalised access to the Whangaehu River is limited, although a number of informal access agreements have been established between fishing and hunting recreation groups or individuals and landowners.

The Whangaehu River is very significant to Maori, with several cultural sites along the river and in the adjacent hills.

The Whangaehu catchment contains a mix of soils formed from sandstone, limestone and siltstone. Land-use in the catchment is predominantly primary production activities – dairying, dry stock grazing, cropping, and plantation forestry – with a few scattered areas of native forest throughout the catchment. There is little evidence of lifestyle type development in the upper catchment, although a number of subdivided lifestyle-sized lots have been created on the Te Ore Ore plains closer to Masterton.

Key Floodplain Management Points

This FMP provides a framework to supply erosion control works at priority locations, increase planting for erosion control and river enhancement, and other limited noxious plant control works which are included into river maintenance activities.

Key characteristics by reach:

Upper Whangaehu

Meandering stream through strongly rolling hills

Mixed forestry and pastoral land use

Open stream margins with sporadic willow and regenerating vegetation in upper reaches

Upper Whangaehu Valley

Transition from stream to river

Strongly rolling valley floor

Steep gorges with mixed indigenous and willow vegetation

Lower Whangaehu Valley

Meandering valley floor course

Mixed willow and kanuka along margins

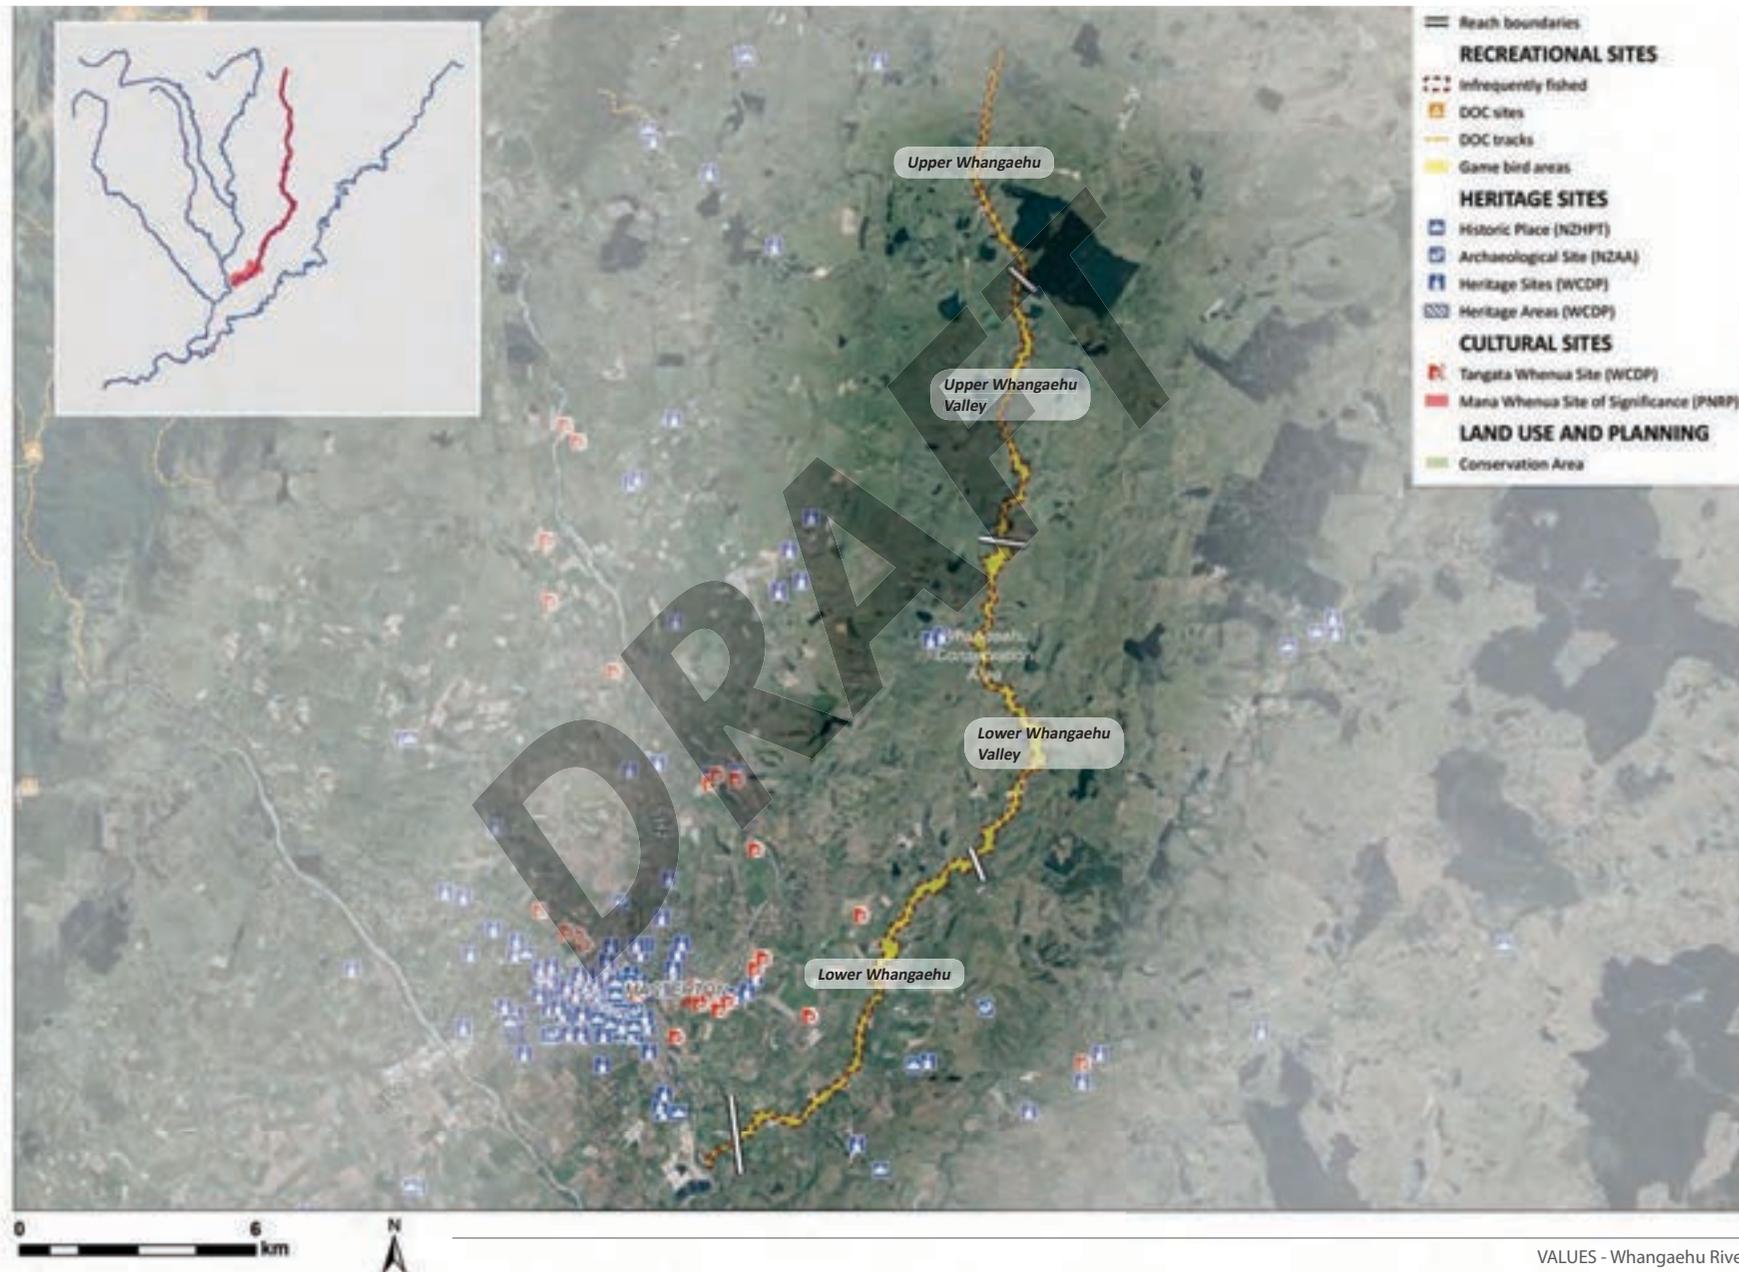

Lower Whangaehu

Steeply incised grass banks

Stock fencing separating river margins from surrounding areas

Mixed poplar, willow and alder planting

VALUES - Whangaeahu River

Whangaehu River

Issues

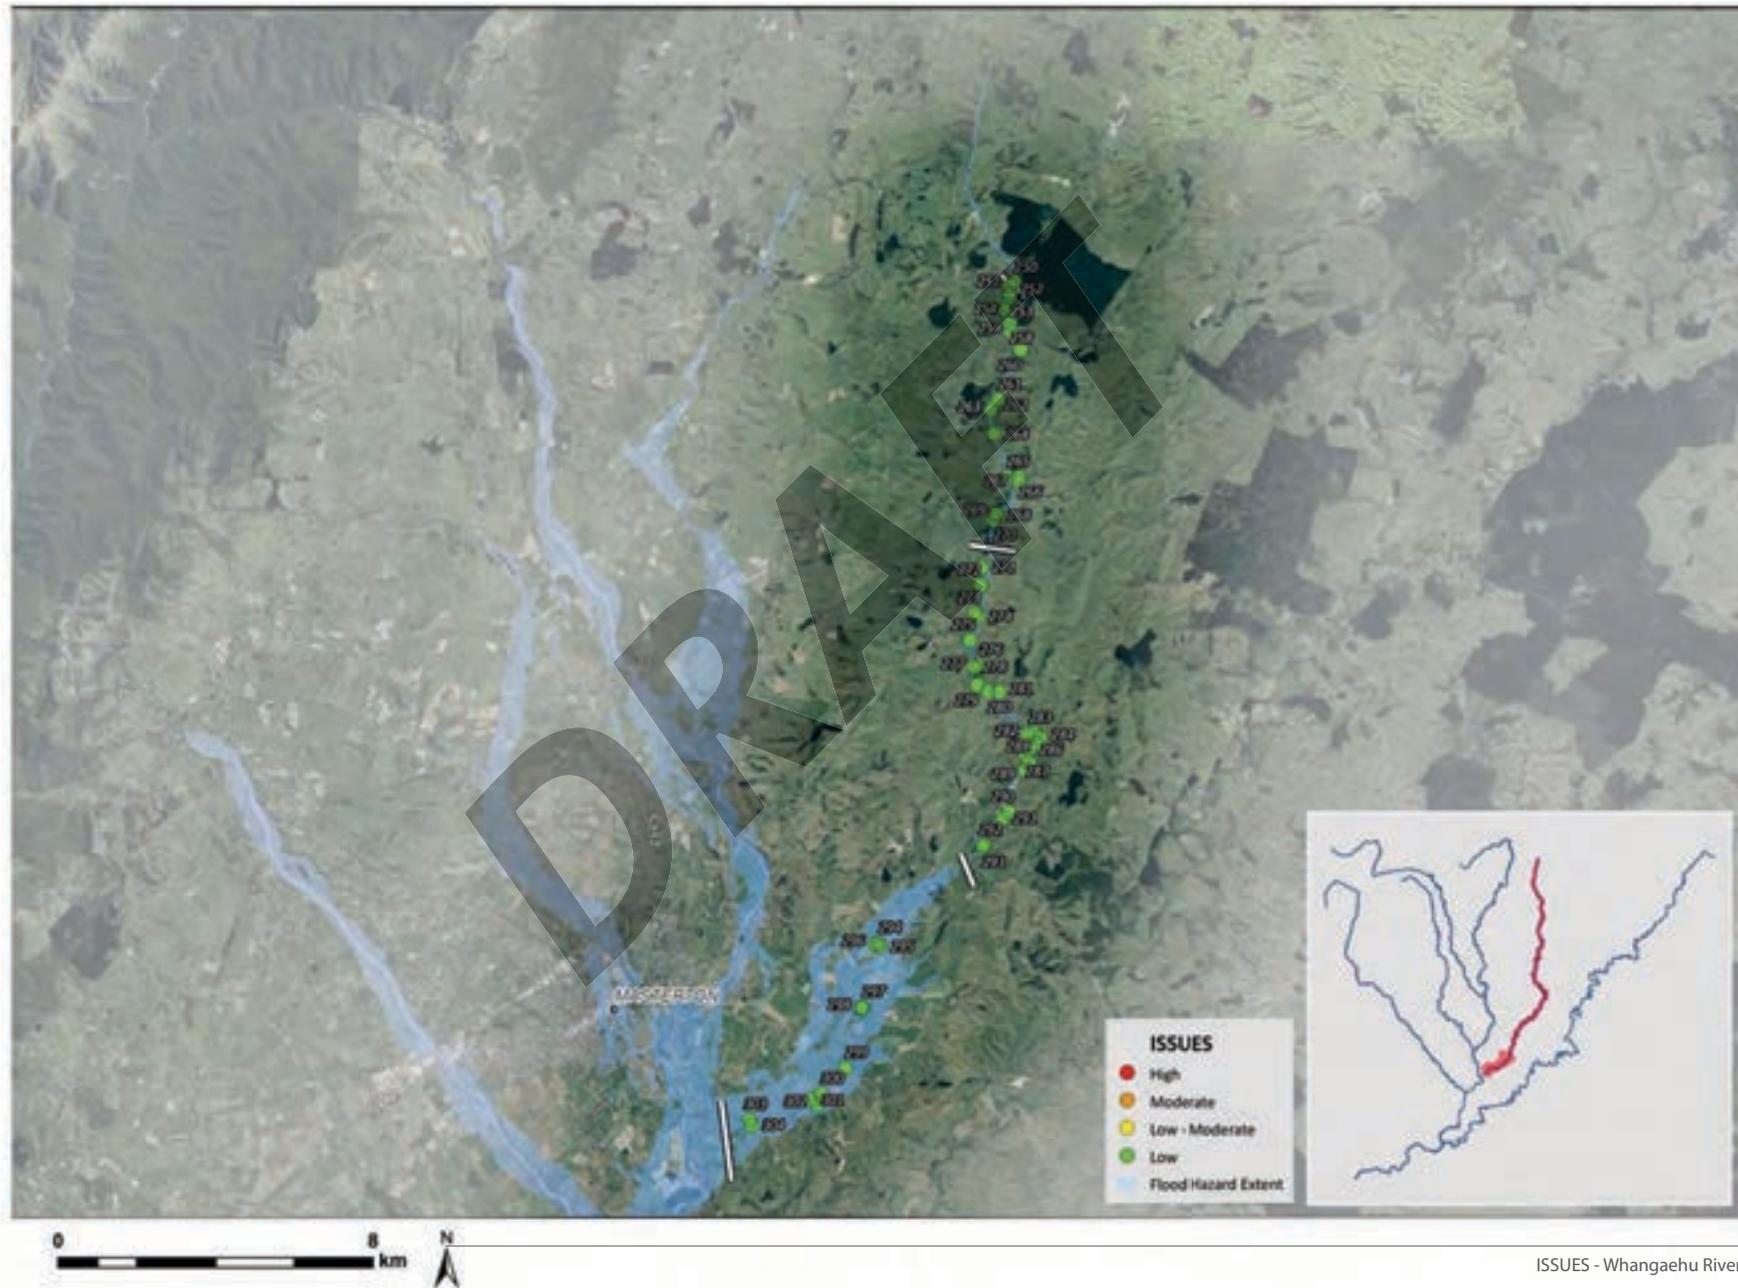

The small channel capacity of the main channel of the Whangaehu is frequently exceeded during heavy rainfall or storm events. When the river overtops its banks the floodwaters flow across the floodplain and into secondary or historic channels spread across the large flat area of the floodplain.

Historically, flooding in the Whangaehu River would have been exacerbated by blockages in the confined channel.

Flooding across the floodplain cuts off a number of communities when the east-west roads from Masterton are flooded. In many places the bridges are high enough above the floodplains to remain dry, but the roads on either side of them are covered with water deep enough to cause severe hazard for motor vehicles.

The erosion risk is relatively small due to the low energy of this river, and its limited ability to modify the surrounding geology. A number of bridges, sections of rural roads, and farm outbuildings are included within the erosion hazard study area. The river is, however, susceptible to silting from its banks and the hills in the catchment.

Whangaehu River

Response

Common methods and specific responses that apply to this reach are set out below. The common methods used to address specific issues are listed in *Appendix 5*.

Reach Specific Responses

	ISSUE ID	SITE	TYPE OF RESPONSE	MEASURES
COMMON METHODS		Within scheme	River management	River edge envelope, recognition of buffers as a river management tool, isolated works support, Code of Practice, mixed vegetation planting, alternative land uses within planted buffers
		Within scheme	Planning and policy	Land use controls, flood hazard maps, rural stopbank policy, scheme decision policy, abandonment/retirement of assets, land access & strategic land purchase
		Within scheme	Emergency management	Emergency management planning, community resilience, flood forecasting and warning system
		Within scheme	Environmental enhancement	Environmental strategy, Community Support Officer, care group and clubs

Taueru River

The Taueru (also known as Tauweru) River forms the eastern most river in the study area and flows through the eastern Wairarapa Hills before connecting with the Ruamāhanga to the west of Gladstone along the eastern edge of the wider Wairarapa Plains. This has a total catchment area of 498 sq km and the main channel has a total length of 69 kilometres.

The river has a number of small tributaries, and comparably, for the size of the catchment, has a relatively small and narrow river channel. The upper reaches of the river pass through strongly rolling terrain containing pasture and forestry. The main river channel in the lower reaches has a relatively low gradient with a meandering pattern.

The Taueru River can be translated to mean “hanging in clusters”.

The Taueru River catchment contains a mix of soils formed from sandstone, limestone and siltstone in the eastern Wairarapa hill country. Land use in the catchment is predominantly primary production activities (dairying, dry stock grazing, cropping, and plantation forestry), with a few scattered areas of native forest throughout the catchment. Farming activity, which dominates the modern land-use along its length, has had a substantial impact on the landform of the river. Pockets of good quality remnant native vegetation remain in some less accessible steep-sided gully areas, including isolated locations where remnant totara and kahikatea can be found. Within the managed area of the river, introduced vegetation in the form of clumps of willow and poplar dominates the channel form. Outside of the managed area, much of the floodplain and banks are grazed. This diverse mix of character has meant that reaches have generally been classified as having medium level of modification.

The floodplain of the Taueru River is relatively sparsely populated, with the development spread evenly along the length of the river and generally confined by the topography of the narrow valley.

The Taueru is particularly significant to Maori due to its historic significance as a travel route towards the north east and the coastal areas along the eastern side of New Zealand. This led to the formation of a number of settlements. There are several cultural sites identified along the river including locations of pa, urupa and mahinga kai. The Taueru River was a particularly abundant source of freshwater crayfish. Eels were more abundant in lower reaches of the river and today these parts of the river remain a valued fishery.

The remnant pockets of native vegetation and the river form make it important in some locations for recreational pursuits, which include game bird hunting, fishing and kayaking.

The lower reaches of the Taueru include several RAP sites, including Te Kopi Road and Peter Bush.

Key characteristics by reach:

Upper Taueru

Mixed forestry and farmland

Meandering stream with open grazed margins

Corridors and clumps of willow and poplar trees

Bideford

Meandering willow lined corridor

Isolated gorges with remnant totara and kahikatea

Bramerton

Sweeping river form, semi-enclosed river corridor

Open grazed pasture banks

Pockets of remnant indigenous forest

Taueru

Meandering course cut below river terraces

River terracing containing historic settlement

Open grazed margins with sporadic willow, poplar and eucalypts

Weraiti

Incised channel meandering through enclosed river terraces

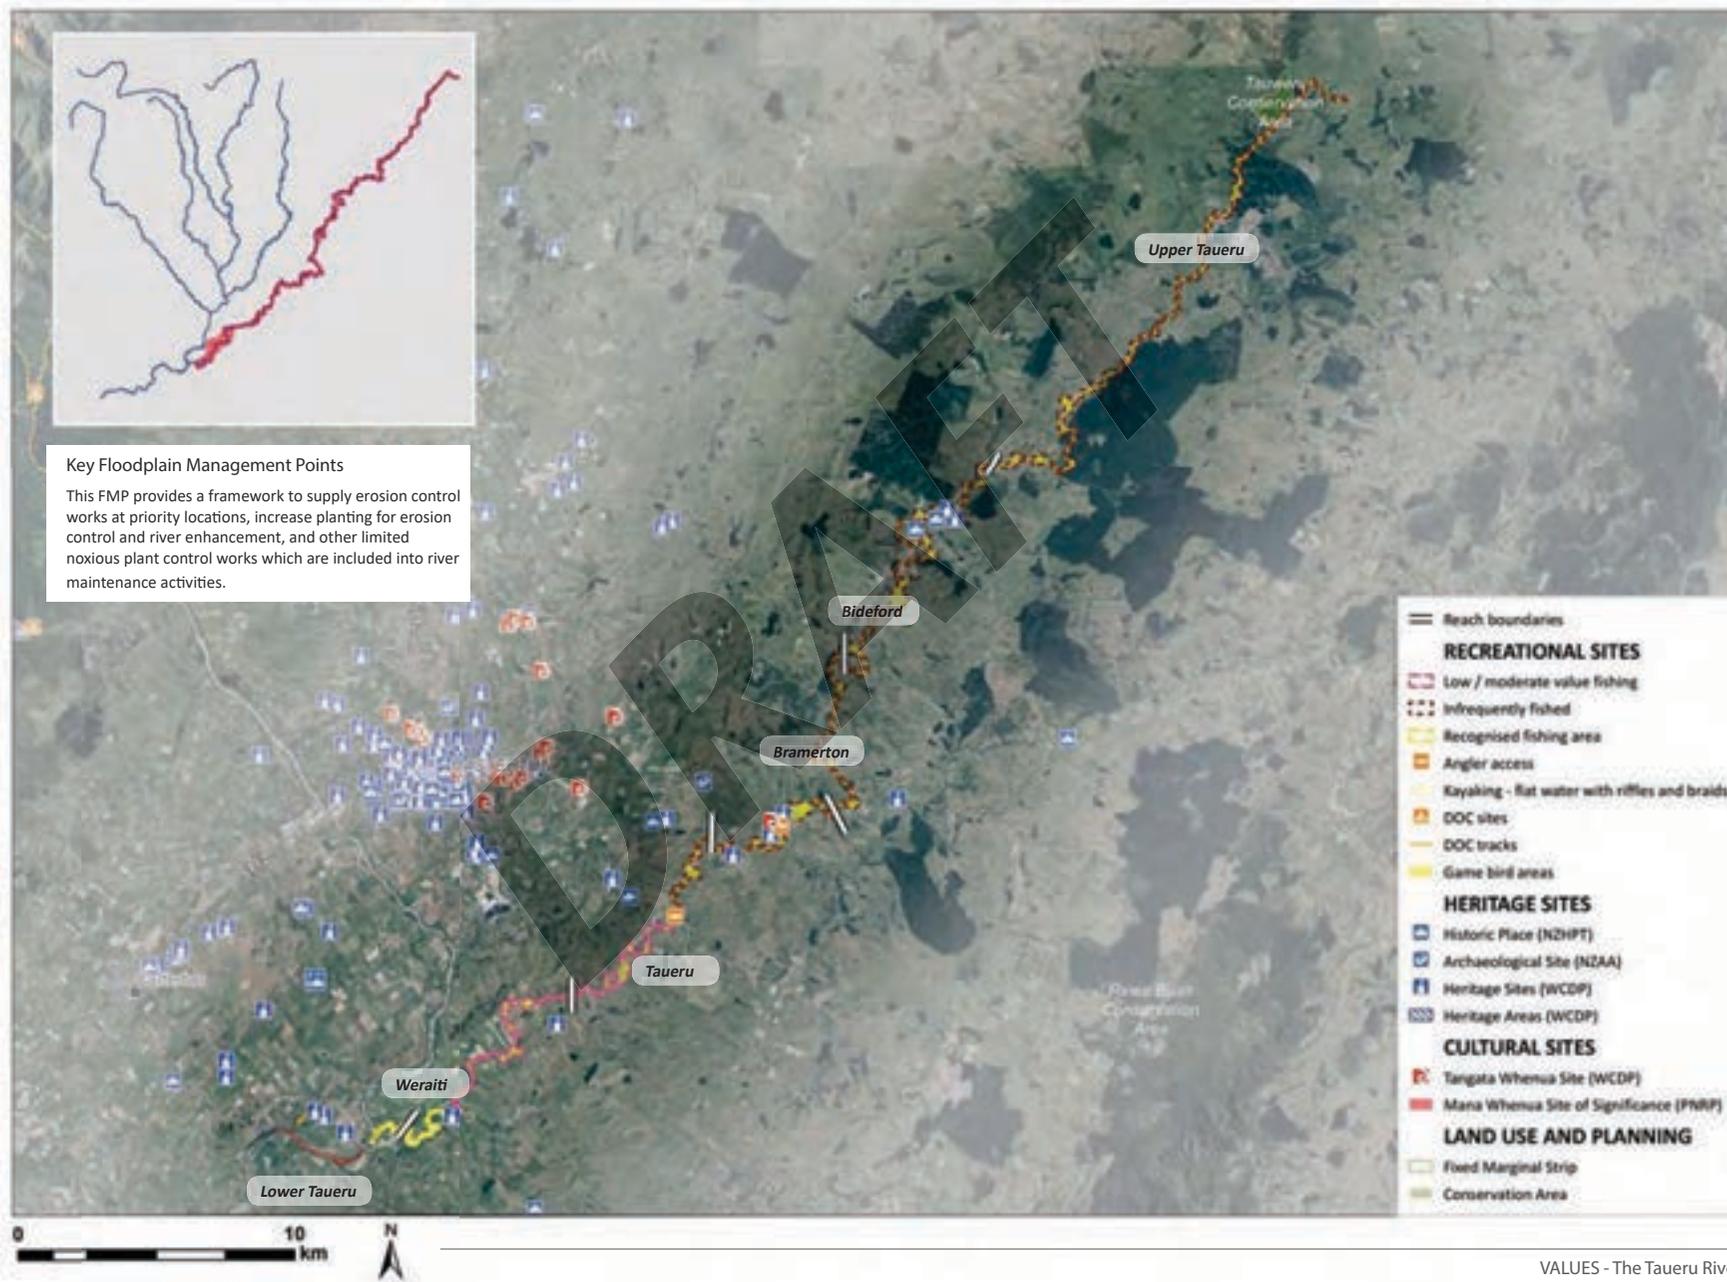

Mixed willow and pasture margins

Lower Taueru

Incised channel meandering through the Wairarapa Plains

Grassed margins separated from surrounding rural land use

Taueru	Medium	Medium	Angler access, game bird hunting, infrequently fished	-	Historic pa site, urupa and mahinga kai	Rural (Primary Production), Road, River.	Unfenced indigenous forest, Mixed exotic-indigenous forest, Indigenous treeland, Natural wetlands and ponds
Weraiti	Medium	Low / Medium	Angler access, game bird hunting, low/moderate value fishing	-	-	Rural (Primary Production), Rural (Special), Road, River.	Unfenced indigenous forest, Mixed exotic-indigenous forest, Indigenous treeland
Lower Taueru	Medium	Medium	Kayak access, kayaking, game bird hunting, excellent fishing	Memorial Oaks (WCDDP)	Urupa	Rural (Primary Production), Rural (Special), Road, River, Flood Protection and Mitigation.	Te Kopi Road (RAP), Peter's Bush (RAP), Unfenced indigenous forest, Mixed exotic-indigenous forest, Indigenous treeland, Natural wetlands and ponds

Taueru River

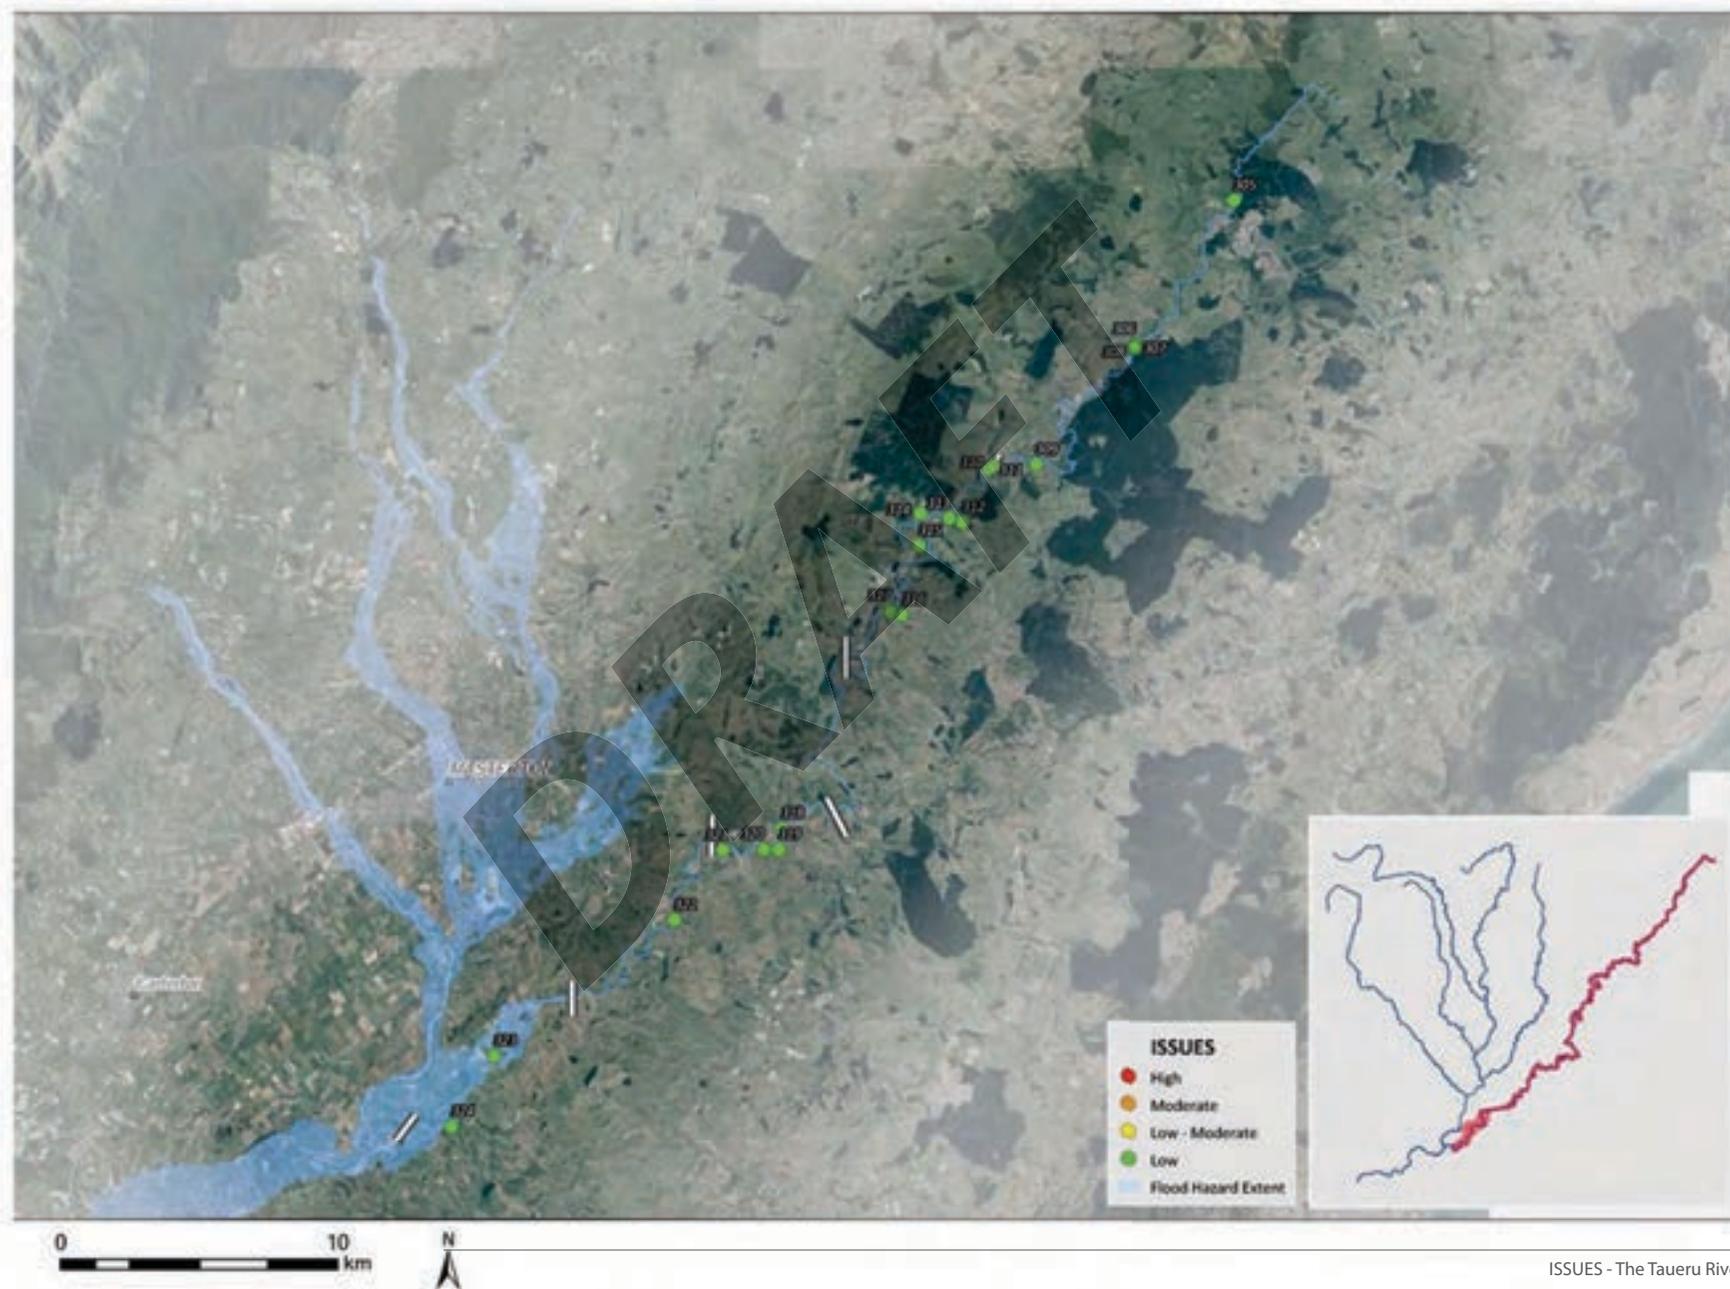

Issues

Flooding frequently overtops the banks of the river to flow across the floodplain, and to a lesser extent through secondary channels. The large catchment of Taueru has led to some significant floods in the past.

The key risks relate to flooding of productive land, access routes to residential property, and the flood risk for rural homes.

The erosion risk posed by the Taueru River is very limited, and only a small number of bridges and structures sit within the erosion hazard study area. The river however is susceptible to heavy silting from sediments washed from its banks and hills in the catchment.

Appendix 1: Floodplain Management Planning Process

Floodplain management planning is the process that aims to create a plan for how to keep people and property safe from floodwaters, and at the same time puts in place steps to prepare people for coping with a flood when it occurs. Specifically, the FMP process involves recognising the necessity to manage risks to life and property, and the economic effect of flooding on the community. It also recognises the impacts of river management practices on environmental, cultural, and social wellbeing.

Work on this FMP began in 2012. Information has been gathered from a range of sources and ideas have been discussed by the FMP Subcommittee. The preparation of this FMP followed a three-phase process as outlined below.

The process followed the 'Guidelines for Floodplain Management Planning' (GWRC, 2013).

Phase 1 - Investigation

The first phase of work involved collecting data and establishing and understanding the flood and erosion problems. In doing this, a clear picture of values of the rivers and the adjacent floodplains was recognised alongside the existing flood and erosion risks. This required an understanding of the relationships between flood hazards, people and communities including the values that are shared and the way in which the interactions between these are managed.

On the technical level, this phase involved hydrological/climatic assessment, cultural values assessment, ecological and landscape assessment, hydraulic modelling and flood hazard mapping, flood damage assessment, and the assessment of implications for existing zoning. During this phase, a significant flood risk was identified for the Masterton urban area from flooding of Waipoua River.

Contact and briefing with affected parties and the community was also carried out by way of an open day and letter drop as well as presentation of the flood hazard maps in Masterton.

The Te Kāuru Upper Ruamāhanga FMP Subcommittee

The FMP Subcommittee, made up of community and local government representatives, was also established during Phase 1. This Subcommittee was set up as a focus and governance group to assist with the different phases of this work.

The Te Kāuru Upper Ruamāhanga River Floodplain Management Plan Subcommittee, chaired by Bob Francis, is made up of:

- the GWRC Councillor for the Wairarapa constituency;
- one other GWRC Councillor;
- one elected member each nominated by Masterton District Council and Carterton District Council;
- one member nominated by Kahungunu ki Wairarapa;
- one member nominated by Rangitāne ō Wairarapa;
- up to two members nominated by the existing scheme committees; and
- up to four community members appointed for their skills and experience relevant to the work of the Subcommittee, whom are all appointed by Council.

Over the course of the FMP development, a few members joined and left the subcommittee for different reasons. We particularly want to acknowledge Councillor Gary McPhee and Siobhan Garlick, who passed away during the development of this FMP. All together fifteen members contributed to the FMP Subcommittee process:

	BOB FRANCIS [CHAIRPERSON] Community		STEPHANIE GUNDERSEN- REID Community		CLLR GRAHAM MCCLYMONT Masterton District Council
	FORMER CLLR GARY MCPHEE GWRC		KATE HEPBURN Community		CLLR BRIAN DELLER Carterton District Council
	CLLR BARBARA DONALDSON GWRC		JANINE OGG Community		CLLR ADRIENNE STAPLES GWRC
	DAVID HOLMES River Scheme		RAWIRI SMITH Ngāti Kahungunu ki Wairarapa		MICHAEL WILLIAMS River Scheme
	HORIPO RIMENE Rangitāne o Wairarapa		SIOBHAN GARLICK Rangitāne o Wairarapa		FORMER CLLR MIKE PALMERS Carterton District Council

Phase 2 - Identify and Assess Management Options

This phase of the FMP process saw detailed information gathering and considerable consultation with interested parties and stakeholders. In terms of technical studies and referenced documents, a variety of reports and other documents have informed decisions, as well as provided evidence-based conclusions on how the river can best be managed to control the risks associated with flooding and erosion. The consultation involved numerous meetings, open days, letters, radio coverage, participation in A&P shows, and workshop sessions to gather comments from relevant parties.

During this phase, the aims for this FMP were developed by the FMP Subcommittee in consultation with the community; these are outlined in Section 2.5. Overarching aims for the catchment were elaborated on for different reaches of the rivers. Based on the identified aims, a multi criteria analysis (MCA) was developed specifically for the Te Kāuru catchment to evaluate river management options. This MCA process tested the options against the overarching FMP aims and identified areas requiring improvement to bring their performance to a level acceptable to the subcommittee.

Over 300 issues were identified associated with rivers, flood and erosion risks. These are detailed in the Vision and Aims report, and Part 2 of this FMP.

The technical studies and consultation investigations helped identify and inform flood management options which were considered through a series of workshops run with the FMP Subcommittee including field visits and discussions of the community's needs and appropriate solutions. In this phase, a series of structural and non-structural options were evaluated by the FMP Subcommittee against the aims of the FMP, with the process and outcome being focused on reducing the potential flood and erosion risk.

The FMP Subcommittee workshop topics and associated key decisions are listed in the table below.

DATE	WORKSHOP TOPICS	KEY DECISIONS
20 October 2015	Multi Criteria Analysis (MCA) establishment	
15 March 2016	MCA Recap	Use of MCA
Common Methods applied across Waingawa River		
14 April 2016	Common Methods: <ul style="list-style-type: none"> • River Buffer (banks) • River Buffer (beds) • Pool, riffle and run count • Retreat or Retirement of Assets • Governance and funding 	Support Pool, Riffle, Run Count and Retirement of Assets
17 May 2016	Common Methods: <ul style="list-style-type: none"> • Governance and funding • Mixed vegetated planting • Emergency management • Private bridges across river • Community groups 	Support Mixed Vegetated Planting, Emergency Management and Community Groups

29 January 2019	Urban Waipoua identified approach Buffer Benefits Report – Russel Death Updates to Volume 1	
13 February 2019	Volume 1 Updates Volume 2 Updates Volume 3 Updates Engagement	Planting and weed control key outcomes

There were several key constraints that had to be considered when assessing management options, for example:

- Location of existing assets (such as bridges, roads, houses); and
- Balancing environmental and cultural values of allowing the river flexibility to behave more naturally with the economic costs of the potential loss of productive land.

In particular, the FMP Subcommittee promoted a river management approach that sought to allow the rivers to behave more naturally, with less frequent intervention, within the current envelopes. This was an explicit attempt to strike a balance between improving the river environments and recognising the economic value of the adjacent land (and the views of those landowners).

In addition to the workshops outlined above, approximately 20 Subcommittee meetings were also held in Masterton (open for the public) where the FMP Subcommittee endorsed various steps of the project development. All the reports are available to the public through the GWRC official website.

Phase 3 - Prepare draft Floodplain Management Plan

Based on the evaluation of different options against the vision and aims of this FMP, the preferred option combinations were selected by the Subcommittee and were presented to the community as a “draft” FMP. The preferred options were then presented in draft form (as part of three separate volumes) to the community for feedback.

Consultation

One of the key parts of FMP process has been engaging with the community. In particular, engaging with people who may live on or own flood prone land. This FMP brings together several years of intensive work by:

- Key stakeholders and affected parties;
- The rural community;
- The urban community of Masterton;
- The FMP Subcommittee;
- GWRC, Carterton District Council, and Masterton District Council;
- Ngāti Kahungunu ki Wairarapa and Rangitāne o Wairarapa; and
- Various interest groups, public agencies and businesses.

As part of this work, the FMP Subcommittee was a crucial component of consultation on the future management of the river, has made decisions on detailed technical investigations, and endorsed preferred options for addressing the flood and erosion risks at specific locations. These decisions form the basis of this FMP.

The process of how to contribute to the draft FMP was outlined in the draft FMP Volume 1 document in “Section 5: How can the community contribute?” and in the draft FMP Volume 3 document in “Section 7: How can the community contribute?”.

Appendix 2: Previous River Management Practices

River management refers to works within the bed of the river and on the river banks, and the maintenance of stopbanks. Over the last 50 years, river management schemes have been proposed, developed, and maintained. These schemes collectively reduced, mitigated or managed flooding and erosion risk, with the purpose of protecting people, property, infrastructure, and productive rural land. These schemes were formed at various times based on the wishes and support of the local community.

Previously there were two distinct types of river management schemes operating within the Te Kāuru Upper Ruamāhanga catchment, which reflected the different natures of the rivers. Schemes covering the western side of the valley were dealing with larger, gravel bedded rivers (the Waingawa, Waipoua and Ruamāhanga Rivers). Schemes established on the eastern side included the Kopuaranga, Whangaehu and Taueru Rivers that are smaller, silt bedded rivers coming from the Eastern Hills.

Activities and approaches

The previous approach to flood risk management in the catchment primarily addressed erosion concerns. The gravel bedded river management schemes used a river management envelope as a tool to maintain a sufficient river channel to accommodate flood flows. The aim was to keep the river's channel within a design alignment and plant edges each side of the active bed in appropriately wide vegetated buffers to enable maintenance of the channel over time.

Along fast flowing erosion prone rivers, modern sterile varieties of willow trees are the preferred type of vegetation included in buffers because of their robust nature and vigorous growth combined with an ability to resist erosion. The principle being that the buffers perform the bulk of the erosion protection and allow the scheme managers to manage break-outs of the river alignment before they damage assets and productive land located behind the buffers and stopbanks. In comparison with earlier willow plantings, such as those done historically on the Whangaehu, Taueru and Kopuaranga Rivers, more modern management takes a hands-on approach to establishing and managing the willow plantations so that they do not impinge on the river channel or otherwise cause a nuisance.

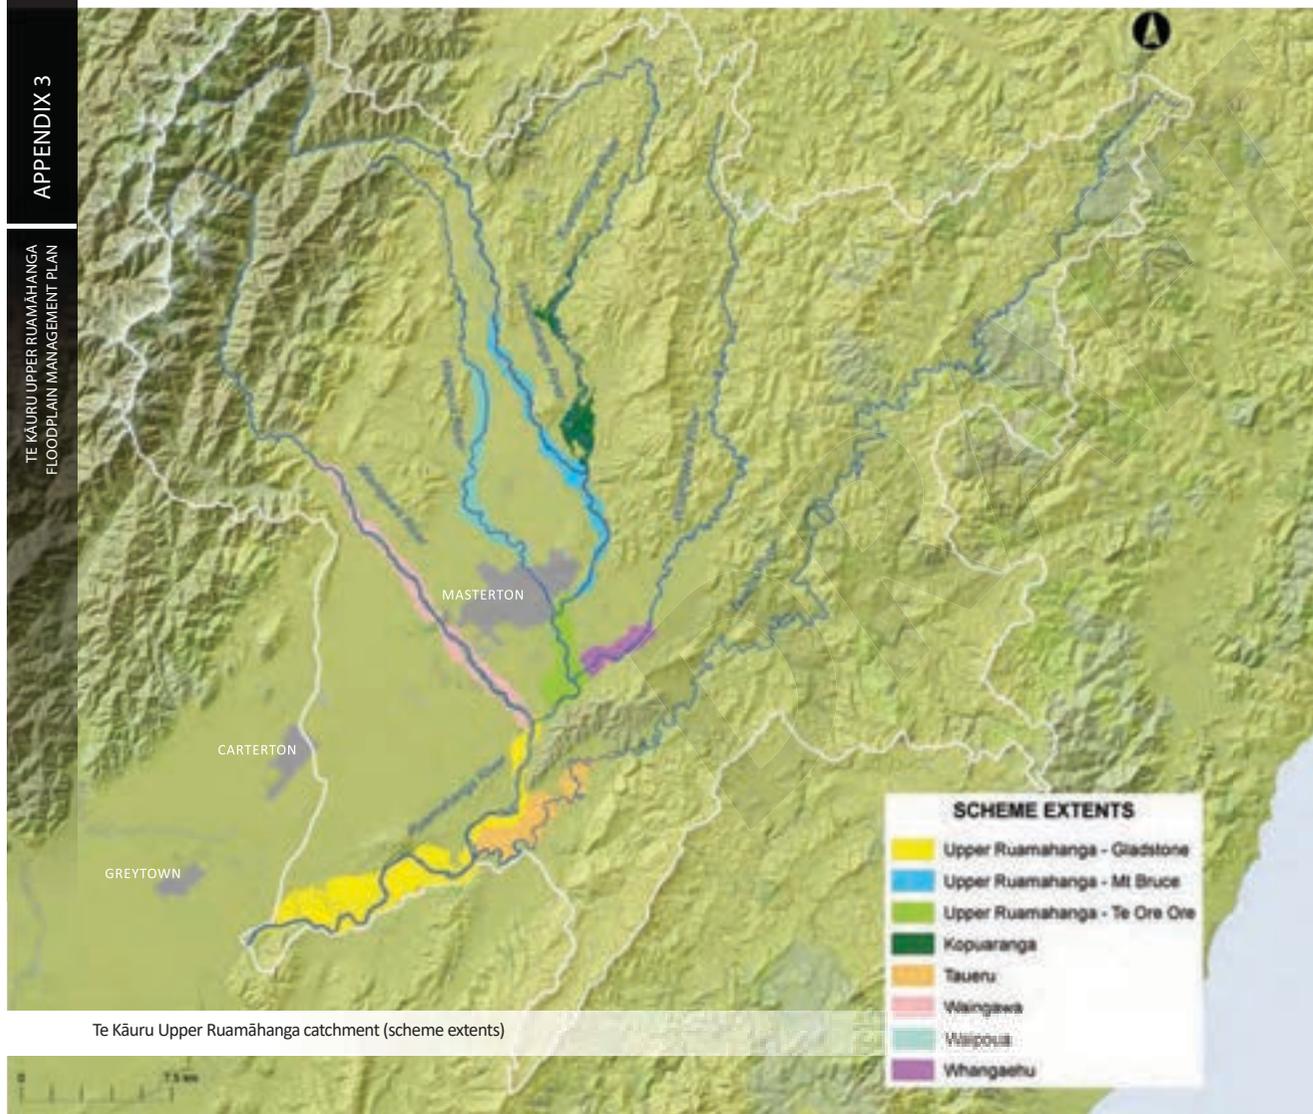

Other complementary river management activities used throughout the Te Kāuru Upper Ruamāhanga catchment have included:

- Gravel extraction;
- Bed and/or beach re-contouring (moving gravel within the river bed);
- Rock rip-rap (placement of rock lines along the edge/bank of the river);
- Rock groyne (placement of rock built out from the river edge/bank); and
- Vegetation clearance to prevent the build-up of islands in the river channel. This type of work involves using machinery such as diggers and bulldozers on the edge of the river, or sometimes in the river channel itself.

The focus of current river management has been driven by a desire to minimise the impact of erosion and flooding on agricultural land and a drive to maximise the productive capacity of that land. Agricultural land use remains one of the key drivers behind the need for river and erosion management and creates the greatest demands on the management of our rivers. This approach came from the prevailing values at the time the schemes were established, where overall economic development was the primary concern. In recent years, concern has been raised about the sustainability of the river management techniques used, and the impacts that these techniques and schemes have had on the river environment and cultural values. As a result of these concerns, and collaborative work between the schemes and community representatives, steps have been made to change or modify these management practices. This FMP aims to build on these improvements and includes the concept of giving the river more room to develop a natural form. It also recognises the full range of river and floodplain values as part of the assessment and option development process.

Gravel management and willow cabling are examples of many works that take place in the rivers.

Te Kāuru Upper Ruamāhanga catchment (scheme extents)

Appendix 3: River Management Schemes of the Te Kāuru Area

Upper Ruamāhanga Schemes

There has been a long history of river management on the Upper Ruamāhanga River associated with human settlement and people's desire to protect themselves and their assets (land and structures) from the negative effects of flooding.

The modern Upper Ruamāhanga River Management Scheme was established in 1982 and covered a length of 58km of the Ruamāhanga River from Mount Bruce downstream to the Waiohine confluence. The scheme was designed to protect an area of about 2,760ha of rural land and a number of public utilities using a combination of stopbanks, vegetated buffers and heavy bank protection. The overall guiding philosophy was based on an established set of design lines.

A major review of the Scheme was undertaken in 2001/02 in response to a number of issues, particularly the river management approach and rating classifications which was considered to be inequitable to certain reaches of the scheme. This review resulted in the Upper Ruamāhanga Scheme being split into three sections, namely the Mt Bruce Scheme (25km), the Te Ore Ore Scheme (9km), and the Gladstone Scheme (24km), to reflect the typical quantum of works required and the subsequent relative rating requirements of each section of the river.

Waingawa River Scheme

The Waingawa River Management Scheme covers a length of 17km, stretching from the Atiwhakatu Stream to the Ruamāhanga River confluence downstream. The river is bisected by a number of geological fault lines and this influences the natural characteristics of the river. The floodplain is generally well defined by clear river terraces, indicating where the river has been over a geologic timeframe, although cross country overflows towards Masterton were possible prior to the construction of stopbanks in the vicinity of West Bush/Skeets Road. After a series of floods in 1988 local landowners and the District Councils put forward a request for a river management scheme be set up to manage the effects and to provide ongoing protection to land and community assets. The scheme was established in 1992. Prior to establishing the scheme, any work carried out in the river to mitigate flood and erosion damage was carried out by individual landowners or the utility owner at their own expense.

A significant aspect of the scheme was the mechanism for encouraging the retirement of private land adjacent to the river for the creation of a vegetated buffer. This mechanism involved the agreement of the owner, who then received 10% of the assessed value of the land and the remaining 90% of the assessed value being credited to the scheme rating district to partially offset scheme costs. Over the first 15 years infrastructural assets were developed to mitigate erosion damage, course change and flood hazard to Masterton. After this phase the scheme focused on maintenance works.

Waipoua River Scheme

The Waipoua River Management Scheme covers a length of 18km, stretching from the Mikimiki Bridge to the Ruamāhanga River confluence downstream.

The Waipoua River Scheme was originally established in 1954 to mitigate flooding and erosion hazards for rural land and the Masterton urban area. The scheme was designed to protect an area of about 770ha from flooding. The Scheme consists of stopbanks, grade control weirs, vegetated buffers, protective willow plantings and rail-iron groynes.

The scheme is split into two parts; the rural reaches and the Masterton urban reach. GWRC is responsible for the implementation and maintenance of both components; however, the funding of the maintenance works within the Masterton urban area is split 50/50 between GWRC and Masterton District Council. There are three grade control weirs in the Masterton urban reach that maintain the water level in the river to ensure sufficient water supply to Queen Elizabeth Park. These weirs are within GWRC list of assets.

Kopuaranga River Scheme

The Kopuaranga River Scheme covers a length of around 27km, from just downstream of Mauriceville to the confluence with the Ruamāhanga at Matapihi. It was established in 2007 in response to flood events during 2004 and 2005. Willows within and near the Kopuaranga River channel were impeding river flows, resulting in reduced channel capacity. The effect of this willow growth was more frequent flooding, particularly on properties in the lower sections of the Kopuaranga catchment. Following community consultation, a scheme was established to fund the selected removal of willows and re-planting of native and exotic species in the lower catchment. In addition, an ongoing maintenance programme involving spraying or cutting willows is undertaken as required. Since the establishment of the Scheme, progressive removal and re-planting of willows has been undertaken.

Whangaehu River Scheme

The Whangaehu River Scheme covers 9km of the river and is a relatively small scheme in terms of the scope of works carried out and expenditure. This scheme was established in 1995 in response to worsening flooding resulting from increased congestion of the river channel from willows and other debris. The scheme extends from the confluence with the Ruamāhanga River up to the Masterton-Castlepoint Road.

Taueru River Scheme

The Lower Taueru River Scheme covers 18km of the river and is similar in scope to the Whangaehu Scheme. This scheme was established in 1994 to reduce the incidence of flooding in this area due to excessive willow growth within the river channel. The scheme extends from the confluence with the Ruamāhanga River (just upstream from the Gladstone Road Bridge) up to the end of Te Kopi Road. The cause of the flooding (e.g. willow growth reducing the capacity of the river channel) and the resulting scheme works (e.g. original removal of willows and debris, followed by spraying to control re-growth) have many similarities to the Whangaehu River.

Cost of management work (2017) and key protected areas

RIVER	COST OF MANAGEMENT WORK	KEY PROTECTED AREAS
Ruamāhanga	Mt Bruce \$125k – typical annual maintenance cost \$1.5M – Flood Protection assets value	Mt Bruce (\$5k/km), Te Ore Ore (\$17k/km), and Gladstone areas (\$7k/km) Ave. \$\$ spent per km is indicative of the relative levels of service between the three schemes (i.e. low, high, med respectively)
	Te Ore Ore \$150k typical annual maintenance cost \$2.5M Flood Protection asset value	
Waingawa	Gladstone \$160k typical annual maintenance cost \$3M Flood Protection asset value	Masterton water supply intake and the water supply pipeline, The railway and state highway bridges, The bank edge at the end of the Hood Aerodrome runway Local and regional utilities infrastructure
	\$179,000 – annual maintenance cost \$1.4M – Flood Protection assets	
Waipoua	\$110,000 with around \$20,000 identified for the urban reach \$3,664,087 assets	Urban Masterton and other public and private assets
Kopuaranga	\$23,000 – annual maintenance No Flood Protection assets here	The river management scheme covers 27 km upstream from the confluence with the Ruamāhanga River
Whangaehu River	\$7000 – annual budget No Flood Protection assets here	Covers 9 km upstream from the confluence with the Ruamāhanga River
Taueru River	\$5000 – annual budget No Flood Protection assets here	It extends for a length of 17.7km from the confluence with the Ruamāhanga

Appendix 4: Legislative and Policy/Principle Context

An outline of the legislation, policies and principles relevant to preparation of the Te Kāuru Upper Ruamāhanga FMP is set out below.

Legislation

There are four key statutes of particular relevance to floodplain management: the Resource Management Act 1991; the Local Government Act 2002; the Soil Conservation and Rivers Control Act 1941, and the Local Government (Rating) Act 2002.

Each of these performs a distinct and important role in managing flood risk, including the ability for a range of regulatory and non-regulatory measures to be introduced which enable central and local government to more effectively manage such risks (for example, structural measures such as stopbanks, policy and planning measures such as land use controls, and river management responses such as river management envelopes and riparian planting of buffers).

Resource Management Act (RMA)

Natural hazards are a relevant planning concern under the RMA, with the 'management of significant risks from natural hazards' recognised as a matter of national importance (s.6(h)).

To achieve this regional and city/district councils assume specific natural hazard related functions under the Act, with regional councils responsible for controlling the 'use of land for the purpose of avoiding or mitigating natural hazards' (s. 30(1)(c)(iv)) and city/district councils responsible for controlling 'any actual or potential effects of the use, development, or protection of land for the purpose of avoiding or mitigating natural hazards' (s.31(1)(b)(i)).

Functionally, regional councils play a lead role in hazard management, with allocation of responsibilities between agencies outlined in their regional policy statements (s.62(1) (i)).

These requirements, along with other relevant matters in Part 2 of the RMA, provide a regulatory context for regional and city/district councils to control land use to avoid or mitigate natural hazards, such as flooding. This is typically realised through objectives, policies and rules specifically developed for this purpose contained in respective regional and district plans (ss.67/68 and 75/76), and in considering and determining any associated resource consent applications (Part 6 and s.106).

Local Government Act (LGA)

Under the LGA regional and city/district councils are required to have particular regard to the contribution that the core service of 'avoidance or mitigation of natural hazards' makes to their communities (s.11A).

A key requirement under the Act is the preparation of long term plans (LTPs). These act as a vehicle for regional and city/district councils to outline their key activities (expenditure) over the following 10 year planning horizon; they also provide a basis for accountability through the identification and setting of required levels of service and performance measures in relation to groups of activities, such as flood protection (s.93).

As part of the LTP, councils are also required to prepare financial strategies including an indication of the 'expected capital expenditure on network infrastructure, flood protection and flood control works that is required to maintain existing levels of service' (s.101A(3)).

The LTP and associated asset management planning process enables councils to determine the level of natural hazard protection to be provided by their assets (in the case of flood protection works), or the level of event they are intended to withstand (in the case of network infrastructure).

Soil Conservation and Rivers Control Act (SCRCA)

While much of the original SCRCA has been repealed, it still empowers regional councils to undertake catchment works to promote soil conservation or minimise and prevent damage by floods and erosion (ss.10 and 133).

Although the Act provides a mandate to undertake works for the purposes of flood protection and erosion control, it does not compel or require regional councils to act on these matters. Furthermore, any proposed works (e.g. stopbanks) are subject to the requirements of the RMA if the activity is not permitted as of right or a resource consent is required under a relevant district or regional plan (s.10A).

The Local Government (Rating) Act 2002

The Local Government (Rating) Act 2002 replaced the Rating Powers Act 1988, but does refer to it within various sections.

Under Section 23 of the Local Government (Rating) Act 2002 (the Act) outlines the procedure for setting rates. Rates must be set in accordance with the relevant provisions of the long-term plan including the funding impact statement for each financial year.

For public transport, river management, pest management and Wellington regional strategy rates, the Council bases its differential rating categories on those used by each of the territorial authorities in the Wellington Region. Differential rating categories for the Wairarapa river management schemes, Wairarapa catchment schemes and Wairarapa drainage schemes are based on areas identified on the approved classification registers held by the Council.

National Policy Statement for Freshwater Management (NPS-FM, 2014 (Amended 2017))

The NPS-FM is a regulatory instrument issued by the Government under the RMA that provides direction to local authorities on management of fresh water through establishment of:

- a framework that considers and recognises Te Mana o te Wai (the integrated and holistic well-being of the water) as an integral part of freshwater management
- a set of objectives and policies that direct water to be managed in an integrated and sustainable way, with provision made for economic growth within set water quality and quantity limits

Particular provisions in the NPS-FM of relevance to floodplain management include:

- Objective C1 and associated Policies C1 and C2 – these relate to improving integrated management of freshwater and the use and development of land within a catchment.

This, in turn, necessitates regional councils to review the way they manage land use impacts on water quality and quantity, including management of sediment input and land uses that alter water yield (Policy C1), and to recognise the relationship between management of land use, water and provision of all forms of infrastructure, including stopbanks (Policy C2).

- Objective CA1 and associated Policies CA1 and CA2 – these relate to the identification of freshwater management units (FMUs) incorporating all freshwater bodies within a region, along with the establishment of a nationally consistent approach to setting relevant freshwater objectives for these units (the National Objectives Framework).

Ecosystem health and human health for recreation are compulsory values for consideration when developing FMU specific objectives. Aside from these, regional councils may also take into consideration a range of other values, where appropriate to their local/regional circumstances. Such values can include natural form and character (e.g. biophysical, ecological, geological, geomorphological, and morphological aspects), mahinga kai, wahi tapu and water supply (Policy CA2(b) and Appendix 1).

Regional Policy Statement for the Wellington Region (RPS)

The RPS contains a specific topic on natural hazards, with river flooding identified as one of the three most significant natural hazards in the region. It also contains the following natural hazard-related objectives:

- Objective 19: The risks and consequences to people, communities, their businesses, property and infrastructure from natural hazards and climate change effects are reduced.
- Objective 20: Hazard mitigation measures, structural works and other activities do not increase the risk and consequences of natural hazard events.
- Objective 21: Communities are more resilient to natural hazards, including the impacts of climate change, and people are better prepared for the consequences of natural hazard events.

To achieve these objectives the RPS relies on four key policies: two that direct district and regional plans that apply in the region, and two that set out matters that need to be considered by councils when processing and determining a resource consent/notice of requirement, or a change/variation or replacement to a plan. These policies are as follows:

- Policy 15: Minimising the effects of earthworks and vegetation disturbance – district and regional plans.
- Policy 29: Avoiding subdivision and inappropriate development in areas at high risk from natural hazards – district and regional plans.
- Policy 51: Minimising the risks and consequences of natural hazards – consideration.
- Policy 52: Minimising adverse effects of hazard mitigation measures – consideration.

Regarding responsibility for policy implementation, the RPS states that these responsibilities are shared between the regional council and city/district councils (Policy 62), and identifies a range of regulatory and non-regulatory methods, including:

Regulatory

- Method 1: District plan implementation (city and district councils).
- Method 4: Resource consents, notices of requirement and when changing, varying or reviewing plans (Wellington Regional Council and city and district councils).

Non-regulatory

- Method 14: Information about natural hazard and climate change effects (Wellington Regional Council, city and district councils and Civil Defence Emergency Management Group).
- Method 22: Information about areas at high risk from natural hazards (Wellington Regional Council and city and district councils).
- Method 23: Information about natural features to protect property from natural hazards (Wellington Regional Council and city and district councils).

Any Regional Plan or District Plan prepared under the RMA is required to put the RPS into practice. These plans help the respective regional and city/district councils to carry out their resource management functions, including managing natural hazards and their associated effects, and to develop ways to deal with the full range of floodplain management planning issues.

FMP Principles

The FMP approach adopted and implemented by the regional council is premised on a set of four core principles that reflect:

- The evolving nature of council practice in preparing and implementing FMPs throughout the region and the corresponding lessons learnt; and
- The political and economic realities associated with any prospective change to its current approach to managing flood hazard risk (e.g. managed retreat vs building or upgrading flood protection structures).

The principles also reinforce and complement the objectives and policies in the RPS, as well as the council's operational floodplain management guidelines.

The core principles are as follows:

• **Avoid building in areas at high risk of flood hazard**

Avoiding the construction of residential and other buildings vulnerable to flooding in undeveloped urban and rural areas (i.e. a 'greenfields' situation) exposed to a high level of flood hazard is the most effective way of managing flood risk in these locations in the long-term. In areas subject to a lesser degree of flood hazard, activities and development should be appropriate to the circumstances and should not exacerbate flood risk.

• **Only consider new flood protection infrastructure where existing development is at risk**

Where existing urban or rural land use and/or development (e.g. dwellings, irrigation infrastructure, dairy sheds) is subject to an unacceptable degree of flood risk the construction of new structural protection measures (e.g. stopbanks, elevating existing buildings) will be considered. This includes circumstances where, for instance, there is an elevated risk to human life or safety or where the impact on lifeline utilities or the local/regional economy is judged to be significant.

• **Establish standards of flood protection relative to the degree of risk**

In designing and implementing structural and/or non-structural measures within areas subject to flood risk, the following standards are to be applied by GWRC and city/district councils subject to their regulatory processes:

- » Protection of all habitable buildings and urban areas
 - › A minimum 1% AEP flood standard to floor levels for habitable buildings and new development within existing urban areas, along with provision of safe access
- » Stopbank protection
 - › Where required to protect existing urban areas and associated land use, stopbanks will be constructed to achieve a minimum 1% AEP flood standard
 - › Where required to protect rural areas and associated land use, stopbanks are generally constructed up to a 5% AEP flood standard to alleviate frequent or nuisance flood events
- » Plan for climate change in assessing the degree of flood hazard risk and in determining an appropriate response
 - › In assessing flood hazard risk and determining appropriate structural and/or non-structural responses in areas subject to flood risk, GWRC will apply the following allowances for climate change predicted to occur over the next 100 years in the design criteria for its flood hazard investigations:
- » Current allowances
 - › Increases in rainfall intensity - 20%
 - › Sea level rise - 0.8m

The manner in which these principles are applied to specific catchments is largely determined in discussion with individual communities during the process of preparing a FMP. This includes, for example, consideration of such matters as:

- › What constitutes 'an unacceptable level of risk' to the local community and what are the structural and non-structural measures available to reduce exposure to these risks
- › How estimates of potential flood damage are derived (e.g. current land use and potential future losses under existing development conditions vs increased development opportunities and economic growth resulting from the introduction of structural measures)

Appendix 5: Issues Summary

RESPONSES SPECIFIC TO INDIVIDUAL ISSUES - FOR GENERAL RESPONSES FOR EACH REACH REFER TO RESPONSE SUMMARY												
ID	RIVER	REACH	NAME	ISSUE DESCRIPTION	THREAT	AT RISK	RANK	PRIMARY COMMON METHOD	SECONDARY COMMON METHOD	TERTIARY COMMON METHOD	3RD PARTY ASSET OWNER LIAISON	COMMENT
1	Ruamāhanga	2	State Highway 2	SH2 runs close to a gorge section of the Ruamāhanga River and sits within the erosion study area. The risk of erosion here is considered low because of natural rock control. Further information on geology may clarify any risk.	Erosion	Infrastructure	Low	River edge envelope	Code of Practice		3rd party asset owner liaison	
2	Ruamāhanga	2	SH2 bridge	SH2 crosses the Ruamāhanga and the abutments sit within the erosion study area. This section of the river is well entrenched and gorge like and risk to this structure is considered low.	Erosion	Infrastructure	Low	River edge envelope	Code of Practice		3rd party asset owner liaison	
3	Ruamāhanga	2	Scheme upstream boundary location	The upstream boundary of the Scheme sits below the gorge area of the river, it is recommended that this is reviewed in consultation with landowners in this area.	Erosion	Flood Protection	Low to Moderate	River edge envelope				Scheme expansion unlikely
4	Ruamāhanga	2	House	A house at 2036A SH2 sits within the erosion study area extent, but outside the modelled 1%AEP flood area.	Erosion	House	Low to Moderate	River edge envelope	Code of Practice	Emergency management planning	3rd party asset owner liaison	
5	Ruamāhanga	2	House	A house at 1986 SH2 sits within the erosion study area extent, but outside the modelled 1% AEP flood area.	Erosion	House	Low to Moderate	River edge envelope	Code of Practice	Emergency management planning	3rd party asset owner liaison	
6	Ruamāhanga	2	House	A house at 1964 SH2 sits within the erosion study area extent, but outside the modelled 1% AEP event.	Erosion	House	Low to Moderate	River edge envelope	Code of Practice	Emergency management planning	3rd party asset owner liaison	
7	Ruamāhanga	2	Private stock bridge	There is a stock bridge that crosses the river which sits within the erosion study area and potentially at risk of damage from debris flows, bed level changes and flood events.	Flood & Erosion	Infrastructure	Low to Moderate	River edge envelope	Code of Practice	Emergency management planning		
8	Ruamāhanga	2	House	A habitable structure sits within the erosion study area.	Erosion	House	Low to Moderate	River edge envelope	Code of Practice	Emergency management planning		
9	Ruamāhanga	2	SH2	SH2 sits within the erosion study area extent, but is considered to be at low risk because of geology in area and distance from active channel.	Erosion	Infrastructure	Low to Moderate	River edge envelope	Code of Practice		3rd party asset owner liaison	
10	Ruamāhanga	2	Channel alignment	No design channel exists for upstream of scheme boundary.	Erosion	Flood Protection	Low	River edge envelope				
11	Ruamāhanga	2	Private bridge	A private bridge structure crossing the river with abutments is within the erosion study area. This may be susceptible to debris flows, erosion issues, and bed level changes.	Flood & Erosion	Infrastructure	Low to Moderate	River bed level monitoring	Emergency management planning			
12	Ruamāhanga	2	Dunvegan Forest Remnants RAP sites	Dunvegan Forest Remnants are within erosion study area and within the 1% AEP modelled flood extent.	Flood & Erosion	Environment	Low	River edge envelope	Protection against deforestation in the upper catchment	Flood hazard maps		
13	Ruamāhanga	3	Site of regional significance	The Hidden Lakes area is a site of regional significance. It is within the erosion study area extents and current regional planning is unclear if there will be a requirement to protect this against possible future erosion.	Erosion	Cultural Value	Moderate	River edge envelope	Code of Practice	Environmental strategy		
14	Ruamāhanga	3	Outbuildings	Possible farm ancillary buildings are within the erosion study area and within the 1% AEP flood area.	Flood & Erosion	Business	Low to Moderate	River edge envelope	Flood hazard maps	Emergency management planning		
15	Ruamāhanga	3	House	A house at 65 Fenemor Road is located within the erosion study area. It is situated outside the 1% AEP flood area.	Flood	House	Low to Moderate	River edge envelope	Code of Practice	Emergency management planning		
16	Ruamāhanga	3	Houses	Houses near 1158 SH2 are within the erosion study area. The properties around these houses are within the 1% AEP flood area.	Flood & Erosion	House	Moderate	River edge envelope	Flood hazard maps	Emergency management planning		
17	Ruamāhanga	3	House	A house at 1050 SH2 sits within erosion study area. The house is not within the 1% AEP flood area but areas of the surrounding property area affected.	Flood & Erosion	House	Low to Moderate	River edge envelope	Flood hazard maps	Emergency management planning		
18	Ruamāhanga	3	Gravel extraction site	This location is a good gravel extraction point with good current access, it is used and licensed by GWRC Flood Protection.	Land use	Flood Protection	Low	River bed level monitoring	Code of practice			

RESPONSES SPECIFIC TO INDIVIDUAL ISSUES - FOR GENERAL RESPONSES FOR EACH REACH REFER TO RESPONSE SUMMARY												
ID	RIVER	REACH	NAME	ISSUE DESCRIPTION	THREAT	AT RISK	RANK	PRIMARY COMMON METHOD	SECONDARY COMMON METHOD	TERTIARY COMMON METHOD	3RD PARTY ASSET OWNER LIAISON	COMMENT
19	Ruamāhanga	3	Houses	Houses at 8 Opaki Kaiparoro Road and 212 Opaki Kaiparoro Road are within the erosion study area.	Erosion	House	Low to Moderate	River edge envelope	Code of Practice	Emergency management planning		
20	Ruamāhanga	3	SH2	SH2 sits within the erosion study area but is considered to be at low risk because of the geology.	Erosion	Infrastructure	Low to Moderate	River edge envelope	Emergency management planning		3rd party asset owner liaison	
21	Ruamāhanga	3	Railway line	The main north-south railway line sits within the erosion study area, the natural rock control in this area is currently protecting the line. The line is infrequently used.	Erosion	Infrastructure	Moderate	River edge envelope	Code of Practice	Emergency management planning	3rd party asset owner liaison	
22	Ruamāhanga	3	Double bridges	The SH2 and Rail bridges are susceptible to bed level changes. Current bed levels provide adequate freeboard for the bridge soffits, however there are concerns about scour around the piers. The bridge abutments are protected by natural rock controls.	Flood & Erosion	Infrastructure	Moderate	River bed level monitoring	Code of Practice	Emergency management planning	3rd party asset owner liaison	
23	Ruamāhanga	3	Houses	The houses in vicinity of the southern bridge abutment are within the erosion study area, however are likely to be protected by the natural rock controls around the SH2 and Rail bridges.	Erosion	House	Low to Moderate	River edge envelope	Emergency management planning			
24	Ruamāhanga	4	Opaki water race intake	This water race intake is reasonably stable and only requires occasional maintenance to ensure it operates.	Erosion	Infrastructure	Low to Moderate	River bed level monitoring	Code of Practice	Emergency management planning	3rd party asset owner liaison	
25	Ruamāhanga	4	Swimming hole	The double bridges swimming hole is very popular, but it is also a hazardous swimming location.	Land use	Recreation	Low to Moderate	Environmental strategy	Community Support Officer			
26	Ruamāhanga	4	Bluff Rangitumau Road	The road sits within the erosion study area but is likely to be of low risk due to natural rock control.	Erosion	Infrastructure	Low to Moderate	River edge envelope	Emergency management planning			
27	Ruamāhanga	4	Stopbank	Stopbank within the buffer, needs to be moved to the outer extent of buffer and away from erosion pressures from river.	Flood & Erosion	Flood Protection	Low	River edge envelope	Rural stopbank policy			
28	Ruamāhanga	4	Erosion control works	Erosion control works for Rathkeale stopbank are used to maintain the design fairway in this area.	Erosion	Flood Protection	Moderate	River edge envelope			3rd party asset owner liaison	Major project response
29	Ruamāhanga	4	Stopbank	The Rathkeale stopbank is located in the erosion study area. It currently requires protection from bank erosion.	Erosion	Flood Protection	Moderate	River edge envelope			3rd party asset owner liaison	Major project response
30	Ruamāhanga	4	Urupa	A historic urupa site which sits on the edge of a cliff above the Ruamāhanga River and is located within the erosion study area.	Erosion	Cultural	Moderate	River edge envelope	Environmental strategy			
31	Ruamāhanga	4	House	A house at 143A Matapihi Road sits within the erosion study area, but it is outside the 1%AEP flood area.	Erosion	House	Low to Moderate	River edge envelope	Code of Practice	Emergency management planning		
32	Ruamāhanga	4	Rathkeale College buildings	Rathkeale College sheds are located within the erosion study area and the 1%AEP flood area.	Flood & Erosion	Business	Low to Moderate	Flood hazard maps	Emergency Management Planning	Community resilience	3rd party asset owner liaison	Major project response
33	Ruamāhanga	4	Rathkeale College sewage pond	The sewage treatment ponds for Rathkeale College are located within the erosion study area and are within the 1% AEP flood area.	Flood & Erosion	Business	Moderate	Flood hazard maps	Emergency Management Planning	Community resilience	3rd party asset owner liaison	Major project response
34	Ruamāhanga	4	Bed armouring	The river bed is becoming armoured (hard packed together) due to the addition of finer sediments falling onto it from the cliffs above.	Erosion	Flood Protection	Low to Moderate	River bed level monitoring	Isolated Works support			
35	Ruamāhanga	4	House	A house on 7 Matapihi Road is located within the erosion study area but outside the 1% AEP flood area.	Erosion	House	Low to Moderate	River edge envelope	Emergency management planning			
36	Ruamāhanga	4	Houses	At 365 Black Rock Road, the house is located within the erosion study area and sits on the edge of the 1%AEP flood area.	Flood & Erosion	House	Low to Moderate	Flood hazard maps	River edge envelope	Emergency management planning		
37	Ruamāhanga	4	Private water take	A private water intake for an irrigation system is located within erosion study area. No known issues.	Erosion	Infrastructure	Low to Moderate	River edge envelope	Community resilience			
38	Ruamāhanga	4	Outbuilding	A farm storage or utility building is located within the erosion study area but outside the 1% AEP flood area.	Erosion	Business	Low to Moderate	River edge envelope	Code of Practice			

RESPONSES SPECIFIC TO INDIVIDUAL ISSUES - FOR GENERAL RESPONSES FOR EACH REACH REFER TO RESPONSE SUMMARY												
ID	RIVER	REACH	NAME	ISSUE DESCRIPTION	THREAT	AT RISK	RANK	PRIMARY COMMON METHOD	SECONDARY COMMON METHOD	TERTIARY COMMON METHOD	3RD PARTY ASSET OWNER LIAISON	COMMENT
39	Ruamāhanga	4	Road	Black Rock Road is within the erosion study area at this location, it has required erosion protection within the last decade.	Erosion	Infrastructure	Moderate	River edge envelope	Code of Practice	Emergency management planning	3rd party asset owner liaison	
40	Ruamāhanga	4	Houses	147 to 240 Black Rock Road have houses which sit within the erosion study area. The houses on these properties sit outside the 1%AEP flood area.	Erosion	House	Low to Moderate	River edge envelope	Code of Practice	Emergency management planning		
41	Ruamāhanga	4	Water intake	The subsurface gallery intake consent application would be at risk of channel degrade.	Erosion	Infrastructure	Low	River bed level monitoring	Code of Practice			
42	Ruamāhanga	4	Private frost protection intake	The private water intake for frost protection system sits within the erosion study area.	Erosion	Infrastructure	Low	River edge envelope	Code of Practice	Emergency management planning		
43	Ruamāhanga	4	Channel alignment	At XS245+50m - hard edge protection holds a narrow design channel alignment at this location, the river may naturally tend to a wider channel.	Erosion	Flood Protection	Low	River edge envelope	Code of Practice			
44	Ruamāhanga	4	House	138 Gordon Street sits within the erosion study area, but is well set back from the river channel behind a high bank.	Erosion	House	Low	River edge envelope	Emergency management planning			
45	Ruamāhanga	4	Henley Lake water intake	The channel alignment and bed levels in this area cause intake problems for water to Henley Lake.	Erosion	Infrastructure	High	River edge envelope	River bed level monitoring		3rd party asset owner liaison	
46	Ruamāhanga	4	Te Ore Ore stopbank	The stopbank is believed to be of low standard of protection but several properties behind it are affected by the modelled 1% AEP flood area.	Flood	Flood Protection	Low to Moderate	Rural stopbank policy	Code of Practice	Flood hazard maps		
47	Ruamāhanga	4	Industrial yards	Sheds, machinery, possible contaminants are sitting within the erosion study area and the 1%AEP flood area.	Flood & Erosion	Environment	Low to Moderate	River edge envelope	Flood hazard maps	Community resilience		
48	Ruamāhanga	4	Powerlines north of Te Ore Ore bridge	Transmission lines are located north of the Te Ore Ore bridge and the pylons are located outside river bed but may be affected by the erosion study area.	Erosion	Infrastructure	Low	River edge envelope	Emergency management planning		3rd party asset owner liaison	
49	Ruamāhanga	4	Te Ore Ore Bridge	This bridge is relatively new and therefore risk of scour issues is unlikely. It may be affected by changes to weir arrangements, and abutments sit within erosion study area.	Flood & Erosion	Infrastructure	Low	River bed level monitoring	River edge envelope			
50	Ruamāhanga	4	Te Ore Ore weir	Ongoing effects of damaged rock and rail weirs across the river. It is visually unattractive and a safety concern for recreation users of the river.	Erosion	Recreation	High	Code of Practice	Environmental strategy			
51	Ruamāhanga	5	Henley Lake	Henley Lake park area is being eroded and historically has been threatened by erosion. There is a current staged land retreat in progress to allow greater room for the river.	Erosion	Recreation	High	River edge envelope	Code of Practice			
52	Ruamāhanga	6	Powerlines	Transmission lines cross the river, the pylons are located outside river bed but within the erosion study area.		Infrastructure	Low to Moderate	River edge envelope	Emergency management planning		3rd party asset owner liaison	
53	Ruamāhanga	5	Narrow river channel	River flows regularly break out onto paddocks on the true left bank of the river, this alleviates some of the erosion and flood risks to River Road properties.	Flood & Erosion	Flood Protection	Low to Moderate	River edge envelope	Code of Practice			
54	Ruamāhanga	5	Houses	Approximately 14 River Road properties are at risk of erosion from the Ruamāhanga River. They have historically been threatened in floods.	Flood & Erosion	House	High	River Edge envelope	Code of Practice	Emergency Management Planning		Major project response
55	Ruamāhanga	5	Cemetery	The cemetery sits within the erosion study area. It has historically suffered from erosion and light rock protection is in place to manage some of these effects.	Erosion	Infrastructure	Moderate	River edge envelope	Code of Practice			
56	Ruamāhanga	5	Closed landfill	Potential erosion of contaminated material. This area has eroded previously, it is now protected with light rock and willows.	Erosion	Environment	Moderate	River edge envelope	Code of Practice			
57	Ruamāhanga	5	Stopbank	A 10-20-year stopbank infested with trees has an increasing risk of failure which would affect the Wastewater Treatment Plant.	Flood & Erosion	Flood Protection	Moderate	Code of Practice	Rural stopbank policy			
58	Ruamāhanga	5	Channel alignment	The true left bank of the channel in this location is maintained by groynes on an alignment outside of the design fairway.	Erosion	Flood Protection	Low to Moderate	River edge envelope	Code of Practice			

RESPONSES SPECIFIC TO INDIVIDUAL ISSUES - FOR GENERAL RESPONSES FOR EACH REACH REFER TO RESPONSE SUMMARY												
ID	RIVER	REACH	NAME	ISSUE DESCRIPTION	THREAT	AT RISK	RANK	PRIMARY COMMON METHOD	SECONDARY COMMON METHOD	TERTIARY COMMON METHOD	3RD PARTY ASSET OWNER LIAISON	COMMENT
59	Ruamāhanga	5	Stopbank	The level of service of this stopbank is unclear from downstream of the closed landfill.	Flood	Flood Protection	Low to Moderate	Rural stopbank policy	Code of Practice			
60	Ruamāhanga	5	WWTP irrigation beds	A proposed irrigation area is protected by a vulnerable ~2-year stopbank. These irrigation beds currently sit within the buffers and are within the erosion study area and 1% AEP flood area.	Flood & Erosion	Infrastructure	High	Recognition of buffers as a river management tool	Flood hazard maps		3rd party asset owner liaison	
61	Ruamāhanga	5	MDC Waste Water Treatment Plant	The Wastewater Treatment Plant sits within both the erosion study area and the 1% AEP flood area. There are some 1% AEP stopbanks protecting the asset however these are outflanked further upstream.	Flood & Erosion	Infrastructure	Moderate	Flood hazard maps	River edge envelope	Emergency management planning	3rd party asset owner liaison	Major project response
62	Ruamāhanga	5	House	A house at 374A Lees Pakaraka Road sits within the erosion study area.	Erosion	House	Low to Moderate	River edge envelope	Code of Practice	Emergency management planning		
63	Ruamāhanga	5	Road	Lees Pakaraka Road sits within the erosion study area and on the edge of the 1% AEP flood area.	Flood & Erosion	Infrastructure	Moderate	River edge envelope	Flood hazard maps	Emergency management planning	3rd party asset owner liaison	
64	Ruamāhanga	5	WWTP discharge point	The Wastewater Treatment Plant discharges treated water to the Ruamāhanga River.	Land use	Environment	High	River edge envelope	Code of Practice		3rd party asset owner liaison	
65	Ruamāhanga	4	Channel alignment	Historically the channel was wider at this location than the current very narrow design channel alignments.	Erosion	Flood Protection	Low to Moderate	River edge envelope	Historic channel lines			
66	Ruamāhanga	5	Three houses	Three houses in erosion study area are considered to be at lower risk than the road upstream due to high bank and cemented deposits. There is no history of erosion.	Erosion	House	Low	River edge envelope	Code of Practice	Emergency management planning		
67	Ruamāhanga	5	Wardells Bridge	The river bed in the location of this bridge is observed to be a very stable site, with low risk of erosion or scour. The road to the north of the bridge is within the 1% AEP flood area.	Flood & Erosion	Infrastructure	Moderate	Code of Practice	Flood hazard maps		3rd party asset owner liaison	
68	Ruamāhanga	6	Waingawa-Ruamāhanga confluence	Instability from Waingawa flows influences the Ruamāhanga at this location making it a very challenging area to manage and the river management lines are very difficult to achieve.	Erosion	Flood Protection	Low to Moderate	River edge envelope	Code of Practice			
69	Ruamāhanga	6	Ruamāhanga river terrace RAP site	An RAP site is on the edge of the 1%AEP flood extent and within erosion study area.	Flood & Erosion	Environment	Low	River edge envelope	Environmental strategy	Flood hazard maps		
70	Ruamāhanga	6	Channel alignment	The channel is naturally wider than the design channel alignment in this location.	Erosion	Flood Protection	Low	River edge envelope	Code of Practice			
71	Ruamāhanga	6	Houses	There are several houses located in the erosion study area. They are located on reasonably firm material, on a high terrace which is unlikely to erode.	Erosion	House	Low	River edge envelope				
72	Ruamāhanga	6	River alignment	This section of the river has proved to be a challenge to manage to the river management lines and pushes out towards the edge of its buffers on both banks.	Erosion	Flood Protection	Low	River edge envelope	Code of Practice			
73	Ruamāhanga	6	Frost protection water intake	There is an erosion threat to a private water intake located within the erosion study area, the landowner has provided some protection.	Erosion	Infrastructure	Low to Moderate	River edge envelope	Code of Practice	Emergency management planning		
74	Ruamāhanga	6	River alignment	The river alignment in this location needs constant management and if alignment is not well managed, it spills extra water onto Te Whiti Flats, and the Te Whiti stopbank is at risk of overtopping.	Flood & Erosion	Flood Protection	Moderate	River edge envelope	Code of practice			
75	Ruamāhanga	6	Fish habitat	This is a site for fish habitat.	Land use	Environment	Low	Land use controls	Environmental strategy			
76	Ruamāhanga	6	Dakins Road - public road	Erosion affecting the end section of Dakins Road, near Cottier Estate has been addressed in past with rock works. These rock works have protected the immediate area they were installed to protect, but adjacent areas are still affected by erosion.	Erosion	Infrastructure	Low to Moderate	River edge envelope	Isolated Works support	Emergency management planning		
77	Ruamāhanga	6	Te Whiti Stopbank	The stopbank sits within the erosion study area and in places within the current buffers. There is a risk that it may erode and expose protected areas. It currently protects a known flooding area.	Flood & Erosion	Flood Protection	Moderate	River edge envelope	Code of practice			
78	Ruamāhanga	6	Channel alignment	Buffer widths upstream of the Taueru confluence require review.	Erosion	Flood Protection	Low	River edge envelope				

RESPONSES SPECIFIC TO INDIVIDUAL ISSUES - FOR GENERAL RESPONSES FOR EACH REACH REFER TO RESPONSE SUMMARY												
ID	RIVER	REACH	NAME	ISSUE DESCRIPTION	THREAT	AT RISK	RANK	PRIMARY COMMON METHOD	SECONDARY COMMON METHOD	TERTIARY COMMON METHOD	3RD PARTY ASSET OWNER LIAISON	COMMENT
79	Ruamāhanga	6	Fish passage	This is an important confluence between the Ruamāhanga and Taueru Rivers.	Land use	Environment	Low to Moderate	Environmental strategy				
80	Ruamāhanga	6	Gladstone complex	The Gladstone pub, sports fields and several houses sit within the erosion study area and are within the 1%AEP flood area. Despite these risks there is no recorded history of flooding or erosion.	Flood & Erosion	Business	Low to Moderate	Flood hazard maps	River edge envelope	Emergency management planning		
81	Ruamāhanga	6	Gladstone Bridge	There are no known issues of scour or erosion at this bridge, however an exclusion zone applies to 100m upstream and downstream. Freeboard to soffit is ok and debris flow risk is ok.	Flood & Erosion	Infrastructure	Low to Moderate	Code of Practice				
82	Ruamāhanga	7	Stopbank	This stopbank protects farmland and is of very poor quality. It is overgrown with trees and believed to be susceptible to failure.	Flood & Erosion	Flood Protection	Low to Moderate	Rural stopbank policy				
83	Ruamāhanga	7	Ahiaruhe Stopbank	This stopbank protects farmland against small, more frequent, flood events. It is located within the erosion study area and close to the river. It is full of trees and has a high risk of failure.	Flood & Erosion	Flood Protection	Moderate	Rural stopbank policy				
84	Ruamāhanga	7	River access	An easement has been created to allow access to Carter Reserve. This site is not being promoted and there is a risk that disuse may lose future opportunities.	Land use	Recreation	Low	Care groups and clubs	Environmental strategy	Land use controls		
85	Ruamāhanga	7	Gravel extraction site	Ahiaruhe gravel extraction site	Land use	Flood Protection	Low	Code of Practice				
86	Ruamāhanga	7	Outbuildings	Farm or other utility buildings are located within the erosion study area and 1% AEP flood area.	Flood & Erosion	Business	Low to Moderate	Flood hazard maps	River edge envelope			
87	Ruamāhanga	7	Channel alignment	The channel in this locations narrows at XS201 and widens out at XS198. This creates erosion issues upstream and downstream of this location.	Erosion	Flood Protection	Low to Moderate	River edge envelope	Code of Practice			
88	Ruamāhanga	7	Channel alignment	Buffer width on true right bank of river is very narrow and on the true left of river is very wide. The currently managed alignment does not match design alignments.	Erosion	Flood Protection	Low	River edge envelope				
89	Ruamāhanga	7	Channel alignment	The channel naturally widens in this area outside of the design channel alignment.	Erosion	Flood Protection	Low	River edge envelope	Code of Practice			
90	Ruamāhanga	7	Outbuildings	There are outbuildings within the erosion study area and 1% AEP flood area.	Flood & Erosion	Business	Low to Moderate	Flood hazard maps	River edge envelope			
91	Ruamāhanga	7	Kokotau Bridge	No known issues with this bridge, abutments sit within erosion study area and the road to north is within the 1%AEP flood area.	Flood & Erosion	Infrastructure	Low	Code of Practice	River bed level monitoring	Flood hazard maps		
92	Ruamāhanga	8	Stopbank	A small stopbank with a low protection level is within the erosion study area.	Flood & Erosion	Flood Protection	Low to Moderate	Rural stopbank policy				
93	Ruamāhanga	8	Channel alignment	The buffer strip in this area is very narrow and needs to be wider.	Erosion	Flood Protection	Low to Moderate	River edge envelope				
94	Ruamāhanga	8	Channel alignment	The design channel alignment in this location is difficult to maintain and it has been recommended that the design lines may need to be reviewed.	Erosion	Flood Protection	Low to Moderate	River edge envelope				
95	Ruamāhanga	8	Farm buildings	250 Taumata Road contains a number of structures at risk of erosion on the edge of a thin buffer, it is also within the 1% AEP flood area.	Flood & Erosion	Business	Low to Moderate	Flood hazard maps	River edge envelope	Emergency management planning		
96	Ruamāhanga	8	House	A house on 142 Foreman-Jury Road is within the erosion study area and on the edge of the modelled 1% AEP flood area. Several buildings near the address are within the buffer.	Flood & Erosion	House	Low to Moderate	River edge envelope	Flood hazard maps	Emergency management planning		
97	Ruamāhanga	6	Taumata Lagoon	A potential fish habitat site is within the 1% AEP flood area.	Flood	Environment	Low to Moderate	Land use controls	Environmental strategy	Flood hazard maps

DRAFT

Appendix 6: Glossary

1% AEP FLOOD EVENT	A 1% Annual Exceedance Probability flood event has a one percent or one in 100 chance of being equalled or exceeded in any one year. On average, this is expected to occur once in 100 years, based on past flood records, though in reality it could happen at any time.
ACTIVE BED	The area of a river channel which is affected by the river processes of flows, sediment transport and the alteration of bed form during flood events. Outside of flood events, the active bed of a gravel bedded river is normally only partially covered by flowing water (see Wetted channel).
AGGRADATION	Increase in the general level of the active bed through a build-up of bed material sediments. This may arise because a pulse of bed material has moved through a reach or due to changes in river processes affecting the transport of bed material.
AVULSION	Rapid abandonment of a river channel and the formation of a new river channel.
ANNUAL EXCEEDANCE PROBABILITY	The chance of a flood occurring in any given year. The probability is expressed as a percentage. For example, a large flood which may be calculated to have a 1% chance to occur in any one year is described as 1% AEP flood.
ASSET/FLOOD PROTECTION ASSET	A useful or valuable structure or material that is valued by Greater Wellington such as stopbanks, rock lining material, bridges, roads, debris fences etc.
BANK	A defined feature at the edge of an active bed, generally marked by a steep change in slope.
BEACH	A general term for areas of deposited bed material within the active bed that is relatively clear of vegetation, often lying between the low flow channel(s) and the banks.
BERM	An area of relatively low lying land within a waterway beyond the active bed, and generally from a bank landwards to a higher natural feature, or flood-containing stopbank. Berms generally have some form of vegetative cover. They are flooded relatively frequently and provide additional flood capacity, while accommodating erosion and active bed migration.
BOULDERFIELD	Land in which the area of unconsolidated bare boulders (> 200 mm diam.) exceeds the area covered by any one class of plant growth-form.
BUFFER /RIPARIAN PLANTED BUFFER	A defined area along the margin of the river that may be prone to erosion in order to guide priorities for river management purposes. Buffers planted with vegetation to control bank erosion are called riparian planting of buffers.
CATCHMENT	The land area draining through the main stream, as well as tributary streams, to a particular site. It relates to an area above a specific location.
CHANNEL / RIVER CHANNEL	A topographic feature that contains, or has contained, flowing water. The term can be used in a variety of ways depending on context; channels can exist within the active bed of a river, or may refer to the entire active bed. See Wetted channel.
CODE OF PRACTICE	The Code of Practice is the document developed by GWRC that guides all river management activities undertaken by GWRC for the purposes of flood and erosion protection across the Wellington Region.
COMMON METHODS	These provide the suite of methods which are identified in the FMP in response to flood and erosion issues
DEGRADATION	A decrease in the general level of the active bed through removal of bed material sediments. This may arise because a pulse of bed material has moved through a reach or due to changes in river processes affecting the transport of bed material.
DESIGN STANDARD	The standard of the flood management methods designed to contain a flood of a certain size (e.g. the height of river stopbanks).

DESIGNATION	This is an ability to reserve land under the district plan, either to note a hazard or to note the location of a structure to provide protection from that hazard. There are generally strict rules which control what may happen in these areas and they can be used to reserve land for construction in the future
EMERGENCY	A situation that is the result of flood and causes or may cause loss of life or injury or illness or distress or in any way endangers the safety of the public or property.
EMERGENCY MANAGEMENT (CIVIL DEFENCE EMERGENCY MANAGEMENT)	The application of knowledge, measures, and practices for the safety of the public or property. Emergency management responses are designed to guard against, prevent, reduce, recover from, or overcome hazards that may be associated with an emergency. Emergency management includes, without limitation, the planning, organisation, co-ordination, and implementation of those measures, knowledge, and practices.
ENVIRONMENT STRATEGY	Sets the direction for the management and development of the Upper Ruamāhanga rivers and their margins.
EROSION	The process of removal of material from a channel, banks or berms by the river flows
FLOOD	Inundation of an area outside the active bed or banks, baseflow channel or channels, of a river due to runoff from a rainfall event or events.
FLOOD HAZARD MAP	A map showing flood hazard in terms of depth of inundation, flow velocities or combined hazard categories for events of different probability. The maps are produced based on computer modelling.
FLOODPLAIN	The low-lying, flat or gently sloping land adjacent to a river channel that is covered with water during floods.
FLOODPLAIN MANAGEMENT PLAN	Long term plan for sustainable management of flood and erosion risks. These plans detail the Regional Council's priorities for flood protection works for specific rivers in the region and set a vision for managing those rivers. The plans have a 40 year planning horizon with planned reviews every 10-15 years.
FLOOD STANDARD	The defined flood (volume, peak, shape, duration, timing) which a flood defence system and its associated facilities are designed to safely pass.
HABITAT	The place or type of site where an organism or population normally occurs.
HAZARD (FLOOD OR EROSION)	Flood or erosion occurrence the action of which can have a negative impact on human life, property, or other aspects of the environment.
INFRASTRUCTURE	Networks, links and arts of facility systems, e.g. transport infrastructure (roads, rail, parking), water system infrastructure (pipes, pumps and treatment works)
ISOLATED WORKS	Privately owned flood or erosion protection works that are constructed outside areas where Greater Wellington manages community flood protection schemes.
KAITIAKITANGA	Guardian or steward or to have guardianship or stewardship.
LIFELINES	Utilities that provide services essential for the ongoing functioning of a community during and following an emergency. They include utility service - telecommunications, gas, electricity and water; and transportation network - road, rail, port and airport services. Other essential services include hospitals and medical centres, and emergency services, such as the police, ambulance and fire services.
MEANDERING RIVER	A river with a curved channel as opposed to a braided river with multiple channels in the river bed. In planform meandering river has a wave form, where a meander refer to a single bend. Meanders are moving due to river flows, sediment transport and associated scour and deposition of the channel and banks.
MITIGATION	For this plan, the act of moderating or reducing the effects of the flood or erosion hazard or flood protection works.

MAURI	The life essence present in things as a result of their being imbued with that character.
NON-STRUCTURAL RESPONSES	Non-structural responses or measures keep people away from flood waters and help the community cope when flooding occurs. They include planning and policy responses (policies and rules in district plans), voluntary actions (information and advice to help people to make their own decisions), emergency management responses, and other.
OPERATIONAL MANAGEMENT PLAN (OMP)	Operational Management Plans are developed by GWRC for specific rivers to provide detailed guidance on the implementation of an FMP at a reach by reach scale. The OMP identifies the management objectives and reach specific values that must be considered in the selection of the most appropriate river management methods to be used for each reach.
OVERFLOW PATH	<p>Overflow paths (also known as flow paths) include areas in the river corridor and on the adjacent floodplain where a large volume of water could flow during a major event. They are often areas of land which lead fast-flowing water away from the river corridor and over the floodplain.</p> <p>The depth and speed of flood waters are such that development could sustain major damage, and there may be danger to life. The rise of flood water may be rapid. Evacuation of people and their possessions would be dangerous and difficult, and social disruption and financial loss could be high. A blocked overflow path could potentially cause a significant redistribution of flood flows to other areas of the floodplain. Due to water depths and velocities, overflow paths are generally unsuitable for development, unless adequate flood avoidance and/or mitigation provisions are made.</p>
PONDING AREA	<p>Ponding areas are those areas where flood waters would pond either during or after a major flood event. Water speed is slow in ponds, but water levels could rise rapidly. Evacuation of people and their possessions may be difficult, especially on foot, and may need to be by boat. There could be danger to life. Social disruption may be high. Generally, ponding areas are unsuitable for development, unless adequate avoidance and mitigation provisions are made.</p>
POOL, RIFFLE, RUN	These are the areas in the river channel characterised by diverse mix of flows and depths. 'Pool' is an area of low flow channel where depth is relatively greater and velocity of the flow is lower than in the surrounding parts of the river. 'Riffle' is an area of the low flow channel that is shallow and steep with higher flow velocities and unbroken standing waves over the bed material. 'Run' is an area of the low flow channel with relatively fast consistent flow and shallow depths. Runs form downstream of riffles or between pools.
RESIDUAL RISK	The risk of flooding that exists despite the protection provided by flood protection structures. In other words, it is the additional or "leftover" risk due to possible breaching and overtopping of structures such as stopbanks.
RIPARIAN RISK (FLOOD OR EROSION)	The interface between land and a river or stream.
RISK (FLOOD OR EROSION)	The combination of the likelihood and the consequences of a hazard.
RIVER	A continually or intermittently flowing body of fresh water; includes a stream and modified watercourse; but does not include any artificial watercourse.
RIVER BED	The RMA defines a river bed as 'The space of land which the waters of the river cover at its fullest flow without overtopping its banks'. Often the horizontal extent of a river bed defined thus corresponds to the extent of the active bed.
RIVER BED LEVEL ENVELOPE	A management term referring to an area between defined limits within which the measured height of the river bed is allowed to vary, with a minimum of management intervention.

RIVER CORRIDOR	River corridor includes land immediately next to the river channel. It is the minimum area able to contain a major flood and allow the water to pass safely downstream. The extents are identified based on modelled depth and velocities of 1% AEP flood event. The depth and speed of flood waters in the river corridor are such that they represent a potential danger to people and structures.
RIVER MANAGEMENT ENVELOPE	A management term referring to an area between defined limits within which the outer edge of the design channel is allowed to migrate into the buffer under different flow conditions, with a minimum of management intervention.
SELECTED LAND USE REGISTER	Sites that are registered in GWRC's Selected Land Use Register (SLUR) are known (or suspected) to have been involved (historically or currently) in the use, storage or disposed of hazardous substances and as a consequence may contain residues of these substances
SERVICE	As in utility service, is a system and its network infrastructure that supply a community need.
STONEFIELD / GRAVELFIELD	Land in which the area of unconsolidated bare stones (20-200 mm diam.) and/or gravel (2-20 mm diam.) exceeds the area covered by any one class of plant growth form. The appropriate name is given depending on whether stones or gravel form the greater area of ground surface.
STOPBANKS	Banks aligned beside the river to prevent floodwater flowing into floodplain areas. They are also known as flood defences.
STRUCTURAL RESPONSES	Structures or other physical works designed to keep flood waters away from existing development. Stopbanks and floodwalls are obvious examples of structural responses.
SUSTAINABLE MANAGEMENT	<p>As defined by Section 5 of the Resource Management Act:</p> <p>Managing the use, development, and protection of natural and physical resources in a way, or at a rate, which enables people and communities to provide for their social, economic, and cultural well-being and for their health and safety while:</p> <p>Sustaining the potential of natural and physical resources (excluding minerals) to meet the reasonably foreseeable needs of future generations; and</p> <p>Safeguarding the life-supporting capacity of air, water, soil, and ecosystems; and avoiding, remedying, or mitigating any adverse effects of activities on the environment.</p>
RIPARIAN PLANTED BUFFER	Buffers planted with vegetation to control bank erosion.
WETTED CHANNEL	The area within the active bed currently containing flowing water.

COMMUNICATIONS & ENGAGEMENT PLAN
Te Kāuru Upper Ruamāhanga Floodplain Management Plan
PROPOSED FMP CONSULTATION

PURPOSE

The purpose of this communications plan is to describe the proposed steps for the Te Kāuru FMP formal consultation procedure leading up to the adoption of the plan.

The Proposed Te Kāuru Floodplain Management Plan (FMP) will be available for consultation between 13 March 2019 and 14 April 2019. To support the consultation period, we are proposing to undertake a number of engagement activities and events between 23 March and 5 April 2019. The consultation will be followed by public hearings during the week starting 29 April 2019 before the FMP is finalised in June 2019. This process builds on the engagement carried on Volumes 1 and 2 in July to September 2018 and more recently the engagement on Volume 3 in February/March 2019.

BACKGROUND

For more than half a century, rivers in the Te Kāuru catchment – Ruamāhanga River and its six tributaries Waipoua, Waingawa, Taueru, Whangaehu, Kopuaranga and Waiohine – have been managed to protect people, property, infrastructure and farmland from flood and erosion risks. The objective of the Flood Plain Management Plan is to address the challenge of protecting communities from flooding and erosion for the coming years.

The Te Kāuru Upper Ruamāhanga FMP Subcommittee have drafted a plan setting out the preferred combination of options to mitigate current and future flood risks to the Te Kāuru catchment – the area upstream of the Waiohine and Ruamāhanga confluence. The engagement and consideration of options to manage flood risk has been underway since 2014. More recently members of the Subcommittee, officers of Greater Wellington Regional Council (GW) and Masterton District Council (MDC) have engaged with communities on the progress of drafting the final flood management plan since July 2018, these are shown in Table 1. A summary of the previous stages of engagement is available: “Summary of Stages 1 and 2 Engagement – Te Kāuru FMP”.

Table 1: Previous engagement periods

Time frame	Engagement undertaken
23 July – 8 September 2018:	Engagement with rural riverside landowners communities on Volumes 1 and 2 (8 weeks)
1 November – 11 November 2018:	Engagement with urban Masterton community on the updated flood hazard maps (10 days)
6 December – 14 December 2018:	Engagement with urban Masterton community on flood mitigation options and approaches (9 days)
23 February – 5 March 2019:	Engagement with urban Masterton community on Flood Management Options, Approach & Costs, Volume 3 (11 days)

APPROACH

We have engaged with the community sharing updates and seeking feedback on this stage of the plan development since July 2018 with rural and urban residents separately, we will now be consulting with them together on the entire FMP for the first time. Table 2 describes the approach to date.

Table 2: Engagement Stages To date – Summary

Engagement Stage	Engagements activities
Stage 1 Engagement	Spoke to around 400 people, 22 coffee group discussions, drop in sessions, weekend events
Stage 2a Engagement	Spoke to around 140 people, drop in sessions, weekend events, meetings with selected stakeholders
Stage 2b Engagement	Spoke to around 81 people in Masterton, drop in sessions, weekend events, meetings with selected stakeholders
Stage 2c Engagement	Spoke to around 189 people in Masterton, drop in sessions, weekend events, meetings with selected stakeholders

COMMUNICATIONS AND ENGAGEMENT OBJECTIVES

The Te Kāuru Project Team and Subcommittee intend to consult the community in the Te Kāuru catchment and broader public to:

- Inform and raise their awareness about the FMP;
- Answer any questions that they may have, and
- Clarify doubts and concerns that they may have to the best of our knowledge and data available with us.

These objectives are broken down in detail with the corresponding success measures in Table 3.

Table 3: Consultation objectives and measurements

Objective	Measurement
Seek submissions from the community on the proposed FMP	Number of submissions received by 12 April 2019 via post or Have Your Say
Informing and raising awareness of the Te Kāuru catchment community about the FMP on current and future flood risks the rivers in the catchment.	Number of people with whom we engage face-to-face, comments and views of social media posts on events and feedback through Have Your Say.
Informing Te Kāuru catchment about the staged approach to mitigate flood risks and that the implementation of the project will take decades with periodic reviews to check if we are heading in the right direction.	Reaction through traditional media (letters to the editor), comments we received from face-to-face interactions at events and coffee group meetings, social media comments, feedback on Have Your Say.
Informing and raising awareness that the implementation of the FMP will impact council rates, changes to the District Plan and building reports.	Feedback at face-to-face meetings and submissions of feedback forms to indicate how well we have been able to explain the FMP to the community and clarifying their doubts and concerns.

KEY MESSAGES/CALL TO ACTION

To achieve the objectives described above the communications associated with the consultation procedure will put across the following key messages and seek to achieve the following call to action.

Key messages

- We have a proposed FMP for the Te Kāuru catchment
- We would like your submissions
- We have made some changes as a result of earlier engagement processes

Call to action

- Seeking submissions from the Te Kāuru catchment community and the broader public on the Proposed Floodplain Management Plan.
- Inviting the public to meet members of the Te Kāuru Floodplain Management Subcommittee and the Project Team to understand the proposed approach to mitigate current and future flood risks the Te Kāuru catchment.

PROPOSED ACTIVITIES

The consultation phase of the Te Kāuru project will be completed in two parts:

- a. Awareness raising activities and receiving submissions; and
- b. The hearings process

To achieve the objectives and deliver the key messages the following activities are proposed.

- Riverside stall – weekend and weekdays (28 March to 1 April)
- Train station in the mornings – hand out brochures
- Farmers Markets and Car Boot Sales
- Print advertising
- Social media advertising
- Radio advertising
- Use of the Te Kāuru webpage
- Reconnect with urban small groups (Kaitiaki, PK Trusts, Oxford Street) – see if they want another session
- Provide Oxford Street them info in their mail box
- Connect with additional urban small groups, i.e., planting groups at Henley Lake, Railway Cres landowners,
- Mail out to all rural riverside landowners, notifying of submission process and offering to come and talk
- Advising all people who provided specific feedback during engagement rounds of consultation on proposed FMP
- Contact local organisations, i.e. Chamber of Commerce, Masterton South Rotary, Men’s Shed, Community House on Church Street
- Kai and kōrero – similar to a drop in session
- Posters and information at supermarkets, petrol stations, library, local businesses (Ordish & Stevens), Mahunga Golf Course, wherever possible
- Place information at cafes, dentists, doctors, etc.
- Hand out information at local activities, i.e. sports fields, park, school drop off or pick up time, sale yards, Clareville lifestyle auction
- Use email networks of Subcommittee members as appropriate

SUBMISSIONS AND HEARINGS PROCESS

The consultation procedure will include:

- a. A statement of proposal, i.e., the proposed FMP
- b. Establishment of a hearings panel (14 April 2019)
- c. Receiving formal written and oral submissions
- d. Formal public hearings, allowing all submitters to be heard (during the week starting 29 April 2019)
- e. Providing feedback to all submitters of outcomes from the hearings process

PROPOSED RESOURCES

The proposed key resources to facilitate the above actions include:

- Brochures;
- FMP summary document; and
- People.

A more detailed resource list is included in Appendix A to this Communications plan.

RISKS

The project team has identified the following risks (Table 4) and will implement the following mitigation measures.

Table 4: Risks

Risk	Likelihood	Impact	Mitigation
Some community members and stakeholders may raise technical questions and doubts about the project on technical grounds	Medium	Medium	Share technical reports on the project when specifically asked; identify and organise separate meetings with community members and stakeholders to address concerns that are based on technical aspects.
Critical media reports	Medium	Medium-to-low	Back-pocket communications to help mitigate risks from adverse media reporting.
Costs and comparison to Waiohine FMP	High	Medium-to-low	Communication tactics to underline that the flood management plan is a staged process and a clear idea about the costs will not be known for another two years till more investigations and studies are completed.
Community and stakeholders to ask questions on costs, credibility of our data and suggest alternative mitigation measures at lower cost	Medium-to-high	Medium-to-low	Back pocket communications on costs of alternative options that were found unviable such as upstream storage; also underpin the fact that as a council we are conservative in our approach of developing options and we want to make the best use of rate-payer money before investing in the plan and hence we need two years to do more studies and investigations.

Appendix A – Proposed Resources

- Proposed FMP
- Summary document (maybe 12 pages)
- FAQs
- A4 folded brochure – catchment wide mail drop
- Feedback/submission forms
- Posters/boards for information sessions
- Posters for putting around the community
- Billboard advertising
- Signs beside the river
- Te Kāuru pens
- A4 advertisements on the train
- Te Kāuru website
- Social media messaging – including encouraging influencers to spread the word
- Print advertising – Wairarapa Times Age and Wairarapa Midweek
- Radio (pre-recorded interviews)
- Letter for rural landowners
- Letter for Oxford Street residents
- Email for Subcommittee contacts
- People
- *Video (time may be a constraint)*
- *Press releases (will consider if appropriate)*

Report 19.43
Date 13 March 2019
File CCAB-10-688

Committee Environment
Author Al Cross, General Manager, Environment Management
Wayne O'Donnell, General Manager, Catchment Management
Luke Troy, General Manager, Strategy

General Managers' Report to the Environment Committee meeting on 21 March 2019

1. Purpose

To inform the Environment Committee of Greater Wellington Regional Council (GWRC) activities relating to the Committee's areas of responsibilities.

2. Key/Strategic Issues

2.1 Wellington Regional Biodiversity Framework

The Wellington Regional Biodiversity Framework project is progressing well. Applications for members to sit on the project's Collaborative Working Group will be open throughout March and the Group is expected to be established in the first half of April.

2.2 Whaitua Programme

Work programmes for both Awarua-o-Porirua Whaitua and Whaitua Te Whanganui-a-Tara, and the implementation of the Ruamahanga Whaitua Implementation Programme are progressing on schedule, and discussed in Report 19.97 to this Committee.

3. Catchment Management

3.1 Land Management

3.1.1 Wellington Region Erosion Control Initiative (WRECI) Programme

Contract negotiations continue with the Ministry for Primary Industries (MPI) to finalise the milestones for the 2019-2023 Wellington Regional Erosion Control Initiative (WRECI). Recent announcements from MPI about the 1 Billion Trees programme make it important to establish the contract in a way that the two programmes are not competing against each other. This means that

opportunities to support landowners establish plantings in the Wellington region will be maximised.

Part of ensuring the programme delivers the right tree, in the right place requires our staff to be skilled in land use capability (LUC) assessments. A refresher training course dedicated to this fundamental land management tool was provided for staff in February.

Staff receive LUC mapping training from Hawkes Bay expert, Garth Eyles

3.1.2 Akura Nursery

As estimated early pole count has been completed and it is predicted that over 33,000 willow/poplar poles will be cut for the 2019 winter. This is up considerably on our estimations made in October 2018. December rain is the likely reason.

Land Management Staff have commenced poplar and willow survival audits for 2018 plantings. Early indications are showing 93% survival - an excellent result.

3.1.3 Farm Environment Plans (FEP) and contestable fund

The contestable fund programme has approved twenty-two projects in priority catchments for the financial year to date totalling \$257,000 - four projects have been cancelled or delayed since the previous reporting period due to landowner matters. During March the remaining budget of approximately \$150,000 will be allocated to projects outside of scheduled priority catchments.

Projects in priority catchments this year have been evenly spread across dairy and, beef and lamb properties. The majority of projects are focused on riparian management, effluent system optimisation or water use efficiency improvements.

3.1.4 Riparian Programme

A bid is currently being prepared for One Billion Trees Partnerships Grant with MPI to support our Riparian Programme. The partnership grant - if successful - will significantly increase the amount of support available and allow us to be

the point of contact for landowners in the region and remove the need for numerous direct grant applications from landowners to MPI.

3.2 Biodiversity

3.2.1 Key Native Ecosystem Programme

- Titipounamu (rifleman) will be translocated to Zealandia from Wainuiomata Mainland Island, part of the Wainuiomata/Orongorongo KNE site, in March/April. This is now possible due to many years of intensive pest control in the mainland island leading to a significant increase in the population. Following a dip in the population during the recent mast year, current bird count data has shown the population is now stable enough for some to be taken for translocation. An aerial 1080 operation is planned for August to address another predicted mast, and this should further protect the remaining population.

3.2.2 Wetland Programme

- 51 landowners with wetlands are now signed up to the Wetland Programme (a total of 73 wetlands as some have more than one on their property). 29 of these wetland sites have approved Wetland Restoration Management Plans.
- A Wetland Wānanga landowner event was held at O Te Pua Wetland in February, an outstanding natural wetland on the Kāpiti Coast. The event was an opportunity to thank wetland landowners who are part of GW's KNE and Wetland Programmes and for them to network and learn from local wetland bird and weed experts. The event was a success with a great turnout.

Wetland Wānanga event held at O Te Pua wetland in February for wetland landowners who are part of our Wetland and KNE Programmes

3.2.3 Biodiversity Advice

- Staff collated and wrote a GW submission to the Department of Conservation on their Predator Free 2050 Discussion Guide. The submission expressed GW's strong support for the development of a strategic plan for Predator Free 2050. It also emphasised GW's current investment in the initiative and desire for further involvement in it. A draft of the submission was discussed with the Department of Conservation and with the Environment Committee.
- Staff contributed comments to a GW submission on the draft Porirua Growth Strategy 2048. Comments expressed support for the general direction of the strategy and particularly for one of its underlying principles – to promote a 'Harbour-centred city'. PCC is also encouraged to further consider the potential impacts of future development on three Key Native Ecosystem sites in the district.
- The department is continuing to have input on the development of the National Policy Statement for Indigenous Biodiversity (NPSIB) and the New Zealand Biodiversity Strategy (the Strategy). Staff attended a local government workshop on the NPSIB hosted by the Department of Conservation, and another on the NPSIB and the Strategy hosted by the regional councils' Biodiversity Working Group.

3.2.4 Collaborative Restoration Projects

- The annual Lake Wairarapa kākahi count was held alongside a public event called 'Mysteries of the Moana' on in February. The public were invited to discover the hidden world of Wairarapa Moana including its history, fish, invertebrates, plants and secretive birds. The event attracted around 200 people.
- Two well-attended public snorkelling events were held on the first two Saturdays in March at Whitireia Park. While these have always been popular, staff extended the reach of these events further this year by incorporating a range of other family activities such as guided rock-pooling sessions, making cloth bags out of t-shirts, a fun recycling toss, and an artist-led creative art activity. The event was also made more accessible with free bus transport down to the site from a local bus stop, and sustainable transport options such as walking and biking were encouraged.

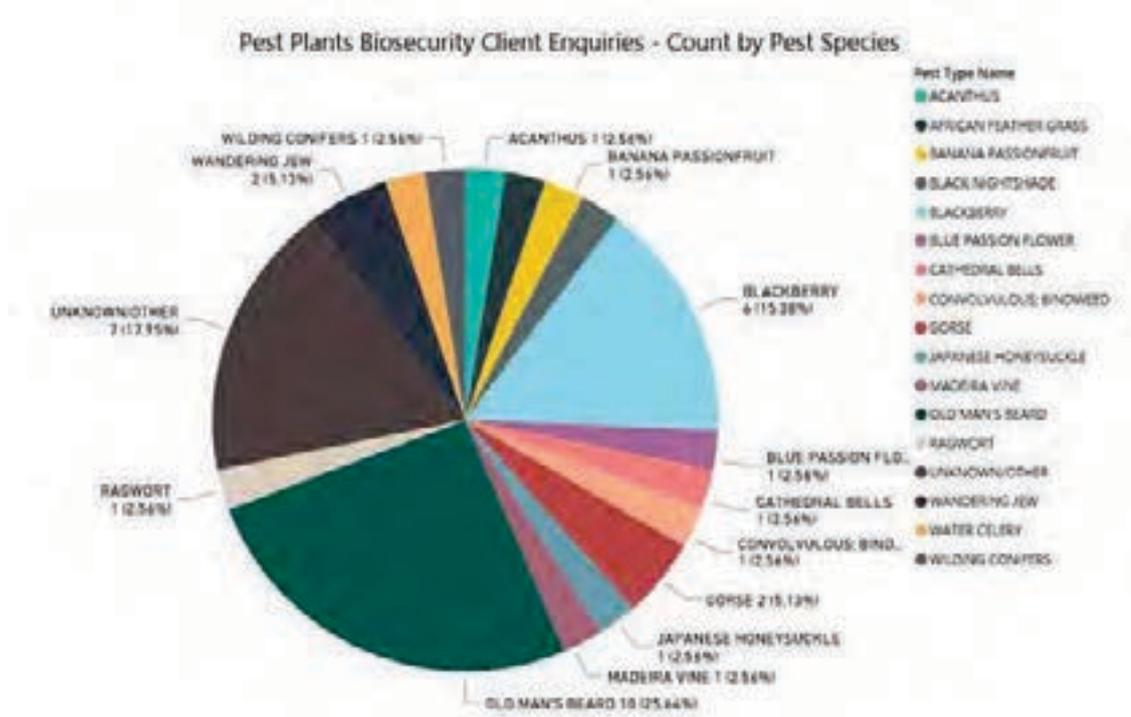

GW staff interacting with the public at dung beetle stall at the 'Mysteries of the Moana' event

Annual Lake Wairarapa kākahi count held at Lake Domain Reserve

3.3 Biosecurity

3.3.1 Public enquires (December 2018 – February 2019) – 147 total

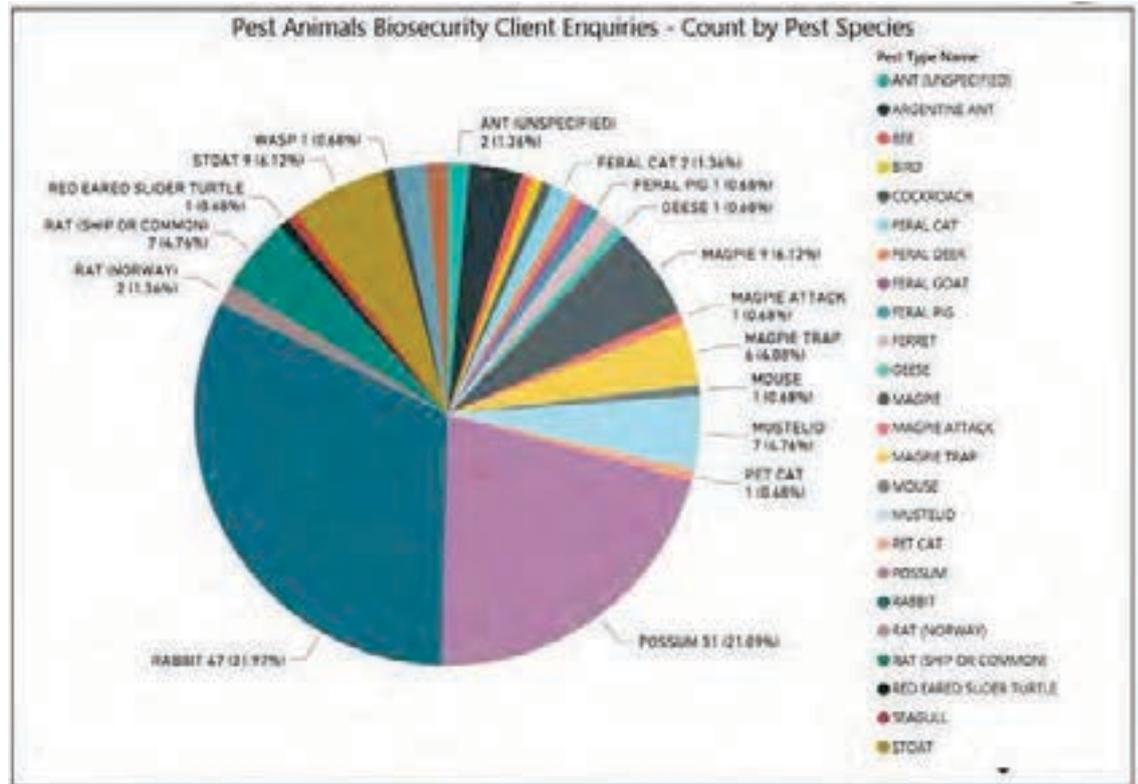

3.3.2 Rabbits

The rabbit spring flush was the most prolific for a number of years across parts of the region resulting in an unprecedented number of public enquiries. Now, when natural feed has dried off, rabbit poisoning has been carried out for lifestyle block owners and around amenity areas that had requested the work.

3.3.3 Predator Free Miramar

Three community engagement advisors are signing up property owners for the pending trapping and baiting operations. Staff met with mostly very positive responses from Miramar residents. Trapping and bait line marking and cutting have started. The next phase of the project will require up to 26 staff on the ground to complete the operation. We plan to recruit a mixture of fixed term staff and contractors for this operational phase of the project.

3.3.4 Public enquiries (December 2018 – February 2019) – 147 total

3.3.5 Regional Possum and Predator Control Programme

Staff are making a significant progress towards completing planned programme for the year with 86,700ha (of 122,000ha) serviced including 2,500ha of mustelid control.

3.3.6 Regional Pest Management Plan (RPMP) Review

Following the final decision from the RPMP submissions hearing panel staff have completed requested changes and the document is in the process of graphic design. We expect to have the draft Plan presented at the May Council meeting.

3.4 Flood Protection

3.4.1 Asset Management and Operations

(a) Western Operations

Work has commenced installing rock protection work along the Hutt River to repair erosion of the riverbank near Gibbons Street, the erosion repair works is expected to take 12 weeks.

Gibbons Street (Hutt River) Erosion Repair, works commenced

The Hutt Gravel Grab took place on the 9th February, a total of 311 vehicles, including trucks and cars town trailers pulled up at Moonshine Park, Upper Hutt to take advantage of the heavy machinery on hand to help extract gravel for the use of residents. We are hoping for a similar turnout to the Kapiti Gravel Grab event on Saturday 16th March.

Hutt Gravel Grab, 9th February 2019

Waiohine River Scheme Stopbank Clearing

(b) Asset Management

The annual flood protection asset condition rating data field was completed which included assessing 6400 assets within a mobile app. The asset management team is now going through a review and verification process of the data before is used to report to the relevant scheme committees, analysis asset performance and assist in developing annual operational work programs.

3.4.2 Investigations, Strategy and Planning

(a) Waiohine FMP

The Waiohine FMP has now entered a new community-led phase to finalise the FMP. This has the aim of producing a solution that has the support of the community. This involves a Project Team (meeting weekly) reporting to and receiving direction from a Steering Group (meeting monthly). There have now been over 10 Steering Group meetings and 50 Project Team meetings (as at 19 February 2019). Good progress has been made, and the Project Team have reached the point where they have selected a preferred option to provide flood protection to Greytown.

Work has also been progressing with establishing a long term GWRC / community relationship to implement the plan and ensure its success into the future. The establishment of the Waiohine Friends Group has also broadened the areas of engagement with community and we are considering options for coordinating this across the organisation.

The next steps are to finalise the river management, planning measures, emergency responses and consulting with affected landowners. All of this information then needs to be combined into a FMP / River Plan document.

Progress on completing the entire FMP will proceed through to at least the middle of the 2019 calendar year.

a) Te Kāuru Upper Ruamāhanga River FMP

Following a workshops with the Environment Committee and Masterton District Council, the Te Kāuru Subcommittee endorsed draft Volume 3 and approved it for use for public engagement on the 21 February 2019.

The engagement on Volume 3, as well as a revised version of Volume 1, began on 23 February 2019. Volume 3 covers a proposed approach for flood management through the Masterton urban area. Revisions have been made to Volume 1, following engagement undertaken in July to September 2018.

Nine engagement events, as well as a media and social media programmes were undertaken from 23 February to 5 March 2019.

The next steps are to update the documents following feedback from the community, combine the three Volumes of the Te Kāuru FMP into a single document, and take the 'proposed FMP' to formal consultation in March/April 2019.

b) Mangatarere FHA

A project team has been established by the community and will be approached on the same lines as the Waiohine FMP. The aim is to complete the FHA by June 2020. The first project meeting is scheduled for the 11th April but between now and then the community will be canvassed for any historic flood information.

c) Otaki FMP Review

The review of the Otaki FMP has restarted. Co-design is on-going with Iwi partners in relation to main capital works and high level operational plans in specific reaches.

The next steps are to hold further meetings to be held with KCDC planning to discuss effectiveness of planning controls and with KCDC roading to discuss Tasman Road raising, as well as continuing dialogue with the Friends of Otaki River.

d) Flood Warning Review

The students group from Winchester Polytechnic have completed the survey work and issued their report at the end of February. The project team is setting up key stakeholder workshops (Wellington Water, GNS, and WREMO) to determine the scope and extent of the Waiwhetu catchment in the Hutt. These workshops will produce a strawman that will be trailed with the community.

3.4.3 Floodplain Management Plan Implementation

(a) RiverLink

The Request for Tender (RFT) for consenting and detailed design services; was released to market on 7 Feb 2019 and closed on 7 Mar 2019. The tender includes work required for GWRC and HCC, but excludes NZTA. The tender allowed for NZTA to join the tender before the tender closing date; however NZTA have not reached a position in regard to the Melling Transport Improvements. The consenting and design phase structure allows for NZTA to join into the process prior to lodgement.

Project governance has been refined to better support the delivery of the next phase of work. This includes creation of a project director role, project office and project board. This replaces the management group and working group structure that used during the previous phase, and creates one point of contact, the project director, for RiverLink rather than this being spread across multiple organisations.

a) **Flood Warning Improvement Project**

In 2017 we completed a flood warning system review. A project is underway to implement the recommendations of this review. The first step is the development of a community-led flood warning system across a number of rivers and streams within the Region.

We have developed a pilot for this improved flood warning system approach, and we have formed a multi-agency team to lead its development. This team is a partnership between Wellington Region Emergency Management Office, Wellington Water, MetService, GNS Science, Hutt City Council, and Friends of Waiwhetu.

The pilot focuses on the Waiwhetu Stream catchment and looks to develop new processes and, if required, investment in supporting infrastructure to meet the community needs.

The work builds on a research project carried out jointly with Worcester Polytechnic Institute, who sought to understand the community needs in relation to flood alert systems.

b) **Pinehaven Stream Floodplain Management Plan**

The Upper Hutt City Council Plan Change 42 appeals continue to proceed following timeframe dictated by court processes.

While this is proceeding on site investigation including geotechnical and geomorphological sampling continues. This supports design work for the future statutory approvals lodgement required for the stream channel, culvert and bridge upgrade works outlined in the Floodplain Management Plan.

c) **Waitohu Stream**

Updates are underway for the Waitohu Stream hydraulic model to incorporate new cross section information and planning services have been engaged to support development of the revised consenting approach for the Convent Road area works. Site investigations relating to existing structures are underway and some small scale works to improve stream care near to Convent Road,

developed and agreed with local landowners, will be carried out in the coming month.

4. Environment Management

4.1 Environmental Regulation

4.1.1 Featherston Wastewater re-consenting

The GWRC officers report was filed on 1 March 2019 (as per the timetable set down by the panel of independent commissioners). The recommendation of the Officer is to decline the application. The reasons for this are based around some very complex planning, legal and technical issues. In essence, in the Officer's opinion, the environmental effects of the discharges were of such an extent it meant that the proposal couldn't meet the tests set out in the RMA, operative regional plans as well as the PNRP. The report was robustly reviewed by GWRC legal counsel prior to release. Contact was made with South Wairarapa District Council (SWDC) prior to the issuing of the report to inform them of the Officers recommendation. The next step is for SWDC to file evidence on 29 March, followed by submitter's evidence on 26 April before the Hearing commences on the 27 May 2019.

4.1.2 Kintyre Meats groundwater take – appeal against conditions

As previously reported Kintyre meats has appealed against a condition of their Category A groundwater take. The first mediation session with an independent mediator was held on 25 February 2019. The appellant brought a technical expert to mediation to argue that their take was not connected to surface water (i.e. not a Category A take) and therefore did not warrant a restriction being applied reducing the take at times of low flow in the river. This was a different position to what had previously been discussed which saw the appellant largely focus on PNRP policy issues. Due to this the mediation has now been adjourned to allow GWRC and the appellant technical experts to confer. Further mediation will resume after such conferencing has occurred.

4.1.3 Western Rivers global flood protection consents

Since the last reporting of this item, The GWRC Flood Protection Department (the applicant) has been attempting to resolve matters raised by submitters. In this regard a number of pre-hearing meetings have been held. These meetings were successful in identifying key issues that remained for submitters and has enabled the applicant to address these issues via updates to the code of practice and draft condition documents.

After the applicant sent an update letter to submitters in late February 2019, we began receiving emails from parties who submitted on the Hutt and Wainuiomata Rivers confirming they no longer wish to be heard at a hearing and that their concerns have been addressed. This is promising as of course if all submitters withdraw their right to be heard then a hearing will not be required for these rivers. Further pre-hearing meetings are scheduled for March/April 2019 to discuss the outstanding issues submitters have with the Waikanae and Otaki River global consent proposals.

4.1.4 Porirua Pilot Project

WWL began to reach out via social media and to community groups in order to communicate, engage and request input from the public regarding the assessment of options for Porirua’s wastewater network and treatment plant. This is going well with a number of meetings held and contacts made, and will continue throughout the pre-application phase. The Porirua Wastewater Project’s collaborative group met early December 2018 to establish the criteria to be used to assess the short-list of options for wastewater network and treatment plant upgrades. The collaborative group are scheduled to meet in March 2019 to agree on the importance of the criteria (weighting) which will be used in the multi criteria analysis (MCA). The outcome of the MCA will be discussed with the collaborative group; and Councils (WCC and PCC) will make a decision on the preferred option. The wastewater treatment plant consents to discharge expire in early 2020.

4.2 Environmental Science

4.2.1 Toxic algae – it was here, now it isn’t...

Hot weather and low rainfall combined at the start of February producing the perfect conditions for toxic algae to bloom. Several rivers throughout the region had blooms over the safe swimming limit, including the Ōtaki River (for the first time in ten years) and Waikanae River. Detached mats of toxic algae also occurred at several of the sites. As well as warning signs posted at popular swimming sites during the bloom, educational signs were also put up.

A drone was used to capture aerial footage showing the extent of the coverage, with the communications team doing a fantastic job of getting it onto social media (check it out on the GW Facebook page; 23 000+ people viewed the post, 12 500 watched the video). The issue has also received national media coverage with Dr Mark Heath being interviewed by RNZ and TV3 NewsHub. Thankfully, the heavy rainfall at the end of February flushed all rivers clear of toxic algae.

Left: detached mats of toxic algae, Ōtaki River. Right: Educational sign

4.2.2 Martinborough water supply

Our groundwater quality scientist and a scientist from the Hydrology team have provided groundwater quality information to South Wairarapa District Council with regard to the security of the Martinborough water supply bores. A report was prepared following the finding of *E.coli* in the Martinborough water supply, which resulted in the need for the community to boil drinking water.

4.2.3 Oil spill wildlife information

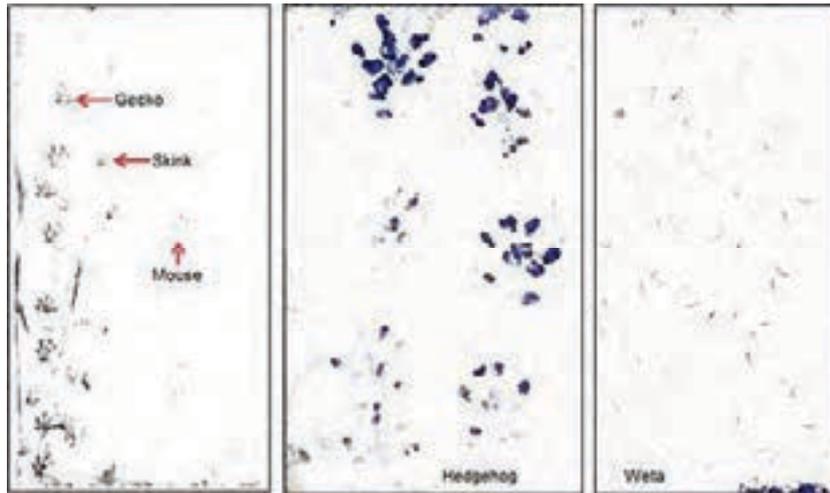

Regional councils are mandated by Maritime New Zealand to maintain preparedness for the event of marine fuel spills. This includes having a regional plan, equipment and maintaining a response team that train together. Wildlife is included in the regional response plan, but the description of wildlife risk sites has grown a bit out of date. Roger Uys, has just completed a review of the sites around the Wellington Region's coast, expanding the number of at risk sites from 30 to 45 to incorporate the significant coastal sites listed in the PNRP. Site descriptions have been up-dated to include maps of all the sites. The next step is to incorporate these updated site registers into Maritime New Zealand's online portal where the registers can be accessed off the national oil spill response mapping tool.

4.2.4 Dune survey find

Dune ecosystems are being visited and assessed around the region as part of the Regional Dune Health Monitoring Programme. A recent survey at Mukamuka dunes has highlighted the importance of the site in terms of ecological values. One nationally threatened and three "At Risk" species were identified; and large areas of pingoa and spinifex recorded. The dunes are hard to access and are largely part of the Remutaka Forest Park managed by the Department of Conservation.

4.2.5 Pest control monitoring Baring Head

Baring Head is part of East Harbour Regional Park, which contains different habitat types, such as river flats, marine terraces and coastal escarpment. A large part of the reserve is being farmed and the rest is retired from grazing. Baring Head is a lizard biodiversity hot spot, and is also home to nesting banded dotterel, tūturiwhatu. Unfortunately, it is also has a very healthy hedgehog population, which are a major threat to the biodiversity of the area. Greater Wellington has been monitoring rodent and small mammals at Baring Head for a number of years now. This monitoring is part of a wider programme of pest monitoring that is used to determine management effectiveness. Since pest trapping has been implemented, the amount of lizard tracking found in our small mammal tracking tunnels has increased.

Various animal prints on Black Trakka™ cards used at Baring Head.

4.2.6 Fish beneath our feet

A pilot study funded by GWRC and WCC to understand the ecological value of Wellington city's piped streams commenced last week. EOS Ecology and Silver Linings Contracting starting sampling for macroinvertebrates and fish in the piped stream that runs below Miramar Park last week. They also set up a camera trap to record what fish move through the pipe over a two-week period. Several eels were spotted during set up. Three more piped streams will be sampled in the coming weeks.

The piped stream study arose following recent monitoring of fish and invertebrate populations in the city's urban streams. Open stream channels, such as those found in Central Park, Prince of Wales Park, and Polhill reserve support populations of banded kokopu and koaro. Knowing that these fish move from the sea to freshwater environments indicates they are using the piped network to migrate to open stream channels, and this has implications for how we design and manage storm-water infrastructure.

Sampling in piped stream under Miramar Park

4.2.7 Flood Warning review

The current focus of the Flood Warning Review Implementation is based around a pilot study that aims to develop a best practice warning system for the Waiwhetu Stream catchment. It is intended that this pilot will provide the basis for a system architecture that can be used in other parts of the region over time. The student team from Worcester Polytechnic Institute in Massachusetts have completed their part of the pilot and have produced a very comprehensive report that outlines the expectations of the community following over 200 survey responses. This work is forming the basis for two workshops with our key warning provision partners (WREMO, MetService, Wellington Water, GNS Science) that aims to develop and test a new warning system model. This work is considered to be leading the way nationally with regards to building fully integrated warning systems for flooding in New Zealand.

Students from Worcester Polytechnic Institute (near Boston in the USA) who have been working on various projects around the region. This year's project was conducting surveys on knowledge, attitudes and preferences on the flood warning systems around the Waiwhetu catchment.

4.2.8 Pirinoa Terraces water allocation investigations

This area has been identified as a 'hotspot' in the Ruamahanga WIP and in need of further investigation to determine sustainable allocation and minimum flow limits. It has also been recently confirmed as one of the 'prototype' areas for work by WIDT and ICE teams. The Turanganui and Tauanui rivers frequently dry out in some reaches in summer and there is some concern from locals that water abstraction exacerbates this. Work so far has focused on establishing flow recorder sites throughout the river catchments. Six automatic sensors river level sensors were deployed earlier this summer and numerous visits have been made by monitoring staff to start calibrating the sensors and

build low flow ratings. A groundwater monitoring bore has also been installed in a QE2 bush remnant adjacent to the Turanganui River. Airborne electromagnetic surveying (by helicopter) is being seriously considered by ESci as a way to map and get a better understanding of the groundwater resources in this area (and other parts of the region). If we go ahead this would be a significant capital project over coming years.

Flowing headwaters of the Turanganui River (flow gauging by Matt Rowland) – Feb 2019

4.2.9 Category-A Groundwater Take Consents Science Review

One of the recommendations from the Ruamahanga WIP was for GWRC to review all Category A groundwater consents (to abstract water) to make sure they are directly connected to surface waters. This is to ensure that the WIP recommendation of 100% cease take at minimum flows for Category A takes is applied appropriately. This review is a significant piece of work as there are about 160 individual consents to assess. We now have a full list of stream

depletion results (for each consent) and are currently undertaking a verification process. We are also preparing summary reports for this work which together with stream depletion results will be peer reviewed. A toolbox is being developed to assist in assessing benefits of various management scenarios (for Cat A bores) to the receiving environment such as small or large rivers both in terms of flows (l/s) and/or as a percentage of mean annual low flow (MALF). We will present the developed scenarios to EPol for their consideration and further decisions.

4.2.10 Working with community

- **Newlands College** – Sheryl Miller and Bryn Hickson-Rowden were all about getting kids out of the classroom and into the local stream recently. Over four days, eight classes of yr9 students from Newlands College were shown methods for collecting and identifying macroinvertebrates, and measuring nitrate and *E. coli* levels in Belmont stream. Students didn't find any *E. coli* but did find nitrate in the main stem of Belmont that runs past the school but not in tributaries. An environmental group of yr10 students will explore these results further.
- **Training modules for SHMAK kit** – Sheryl Miller is working with Mountains to Sea Wellington (MTSW) on a framework for training modules that will be used to assist community groups undertake monitoring of water quality, stream life and stream habitat in their local streams. The modules will complement the NZ Water Citizen web-site and database (nzwatercitizens.co.nz), and SHAMK kit instructional videos due for release in the near future.
- **Supporting kaitiaki monitoring** - ESci is leading a project to develop an approach to supporting kaitiaki monitoring across the region. This is driven, in part, by our proposed natural resources plan and the need to monitor all fresh and coastal water for mahinga kai and Māori customary use. One of the needs identified by currently active kaitiaki is the lack of skilled people and resources to engage with the enormous task of monitoring takiwā across the greater Wellington region. This led to the opportunity to work with iwi leaders and rangatahi through Ngā Kanohi Marae o Wairarapa to provide training opportunities for the next generation of kaitiaki.

Supporting the next generation of kaitiaki in the Wairarapa.

4.3 Harbours

4.3.1 Navigation aids

A channel marker steel pole based at Pukerua Bay has been replaced by a thick plastic pipe due to damage by logs and boats. The new pipe has some flex but should remain sturdy marking a small gap in rocks.

4.3.2 Oil spill planning and response

In February Harbour department met with Maritime NZ Pollution Response staff for a 'health check' - a new programme they are running involving going around the region to have a discussion around spill response planning and capability. This was positive and covered a wide variety of spill related topics.

We met with one of the oil transfer site holders in relation to their response capability and exercising their response plans. By working with them and Maritime NZ we are looking to improve their response capability and enable them to exercise their plans.

This month four reports of hydrocarbon discharge were received in relation to Aotea Quay. On the most recent, along with Environmental Protection we took a sample, hopefully this will enable us to narrow down possible sources. Meanwhile other work is happening on land to try to isolate the source.

Photo source: Wellington Pilot

4.3.3 Safety

- On Sunday 17 February, a 7 metre boat had steering problems while leaving Porirua Harbour. It ended up on the rocks at Whitireia Park and all persons on board made it safely to shore. The following day the vessel was checked and found to have moved. After conversations with the owner and their insurer and parks staff, our staff assisted the owner to recover the boat, put it on the trailer and get it off the foreshore. Any floating debris was removed and there was no pollution observed. The owner was very appreciative of the help received.

- In early February, the Police Maritime unit recovered a 7.5 metre yacht that had been anchored in Evans Bay and had dragged towards the breakwater at the marina. Harbours department was alerted by the marina the following week that the yacht had been returned and secured (apparently) to a more substantial anchor and the owner had gone away for two months. After due consideration the Harbourmaster gave the owner a direction under the *Maritime Transport Act* to secure the vessel more safely. It was considered a danger to other vessels in the mooring and to anyone that would be trying to assist should it drag its anchor again. The owner strongly disagreed. Following legal advice and with the assistance of the Police Maritime Unit, the Harbourmaster had the vessel moved into the Evans Bay Marina. After recovering the anchoring system, it was clear the vessel would have come adrift again. The vessel is in the marina and we will be invoicing the owner for the cost of the berth.
- A written warning was issued to a ships master for not complying with the Bylaws when entering the harbour.

4.3.4 Recreation

On Friday 1 March and Sunday 3 March, Harbours staff along with Police Maritime Unit and Maritime NZ carried out another two “No Excuses” days. These two days focussed on the west coast from Makara to the north end of Kapiti Island and involved staff on shore as well as on our boat Amotai and the Lady Elizabeth IV. Over 100 boats were spoken to. Most boats were compliant, which was a good result. Unfortunately, not all were and three infringement notices were issued, no lifejacket, underage driver (two 13year olds on two PWCs). Two diver boats have been given the option to provide us with proof a dive flag or they will receive infringement and two written warnings have been given for speeding near shore. The overwhelming response on the water was positive to the work that we were doing.

4.3.5 Recreation

Photo : Maritime NZ, Harbour ranger in action

4.3.6 General

Councillor Brash and the Harbourmaster attended the Porirua City Council (PCC) Mayor's presentation to Falelua Leitupo in recognition of him reviving a swimmer that was found unconscious by the Mana boat launching area. The award was well deserved and warmly received. Councillor Brash spoke briefly at the event. This gave the opportunity to raise the issue of conflicting use at the boat ramp with the Mayor and PCC councillors present.

PCC has offered to assist with funding extended hours for the security guard at the boat ramp; an offer that we will willingly accept.

Photo: PCC Recon staff, Falelua Leitupo, Harbourmaster, Cr Brash, PCC Mayor

On 23 February, Beacon Hill received a slightly unusual call from the shore at Ngawi informing them a power pole was on fire and could they contact Fire Control to have the power disconnected. This was duly done and the fire extinguished.

We had three super yachts visit Wellington, two of them chose to anchor in the harbour and we allowed them closer into Lambton Harbour than the standard anchorage. This gave them better access to the city and the city a better view of the yachts.

The US Coastguard icebreaker Polar Star visited Wellington last month. This is the first visit from a USCG in over 30 years. We were involved in a preliminary meeting that among other things looked at safety and security for the vessel. The visit went well.

4.4 Parks

4.4.1 Parks network

Events in the Greater Wellington Great Outdoors programme have been well received over the summer, with many hundreds of people enjoying the opportunities to engage with the parks, GWRC staff and our volunteer partners.

A programme debrief has been scheduled for late March, to capture reflections, review objectives and set a way forward for the future of our summer events programme.

During the month the Parks Planning team organised a visit to the former AgResearch-owned land purchased by GWRC some years ago for future water

supply purposes. Staff were able to see the established farm tracks and infrastructure (bridges, culverts and a SH2 stock underpass), that could provide future recreational linkages between the two main areas of Kaitoke Regional Park and the Remutaka Rail Trail.

4.4.2 Battle Hill Farm Forest Park

Camping remains steady with the continuing good weather, and many weekends have seen the camping ground at capacity. Equestrian events have been well attended over the summer.

Battle Hill Eventing has undertaken extensive work has been on the cross country course, ensuring the jumps meet the health and safety requirements required by Equestrian Sport New Zealand. A clean up of old and disused jumps will occur over the autumn period.

Following a period of strong winds a large limb broke out of a large Macracarpa adjacent to the entry road. An arborist assessment identified other areas of decay and the decision was taken to remove the tree completely.

Damaged Macracarpa, which was eventually felled

4.4.3 Belmont Regional Park

Boundary fencing is underway alongside the eastern side of the Transmission Gully designation. Planting preparation is currently underway with planting

due to start in April once the fencing is complete. GWRC is providing access to sites via the park to support progress in the more difficult sites.

We have seen good progress on construction of the new track connecting Hill Road to the Old Coach Road, with approximately 1.5kms of the 3km track now done. At this stage construction is expected to be completed in mid-April.

The viewing structure on top of the historic Korokoro Dam is being replaced. The aging platform was in poor condition showing the impact of having withstood many flooding events. This work is in conjunction with a wider suite of work to show case the important historic heritage at this location.

Construction of new Hill Rd-Old Coach Rd track underway

4.4.4 Queen Elizabeth Park

Planning for the planting season is well underway, with site preparation and the planting dates confirmed. The season will begin in mid-June and be completed by mid-August.

Preparation is also underway for the second year of planting for the Maclean Trust project, with 7.2 hectares to be planted over the winter. Results from 2018 plantings are showing very good growth in places. There was some loss due to a late season frost in October. Regrowth will be monitored and additional plants will be added to the site to replace losses as required.

Frost damage on manuka

Manuka seedling killed by frost. This seedling was excavated and shows the excellent root growth occurring 3 months after planting.

2018 plantings showing good growth

The final draft of the Wellington Road coastal erosion plan has been completed and meetings to discuss the concepts with the Paekakariki Community, park visitors and stakeholders will get underway in early April. Following this process a final plan will be confirmed and included as part of the Parks Network Plan final draft.

Whareroa Stream walking track maintenance continues, with the application of a hard metal base. Crews will complete the work at this site in winter 2019.

4.4.5 Whitireia Park

The annual hay cut at Whitireia has been completed with 138 large round bales being produced. The removal of the hay lowers the fire risk to the park and increases the defensible space between the coast and the local residents. Many people turned out to watch the haymaking and following completion we have witnessed many more park visitors recreating in the areas of short grass.

Haymaking at Whitireia Park

4.4.6 Wainuiomata Lower Dam

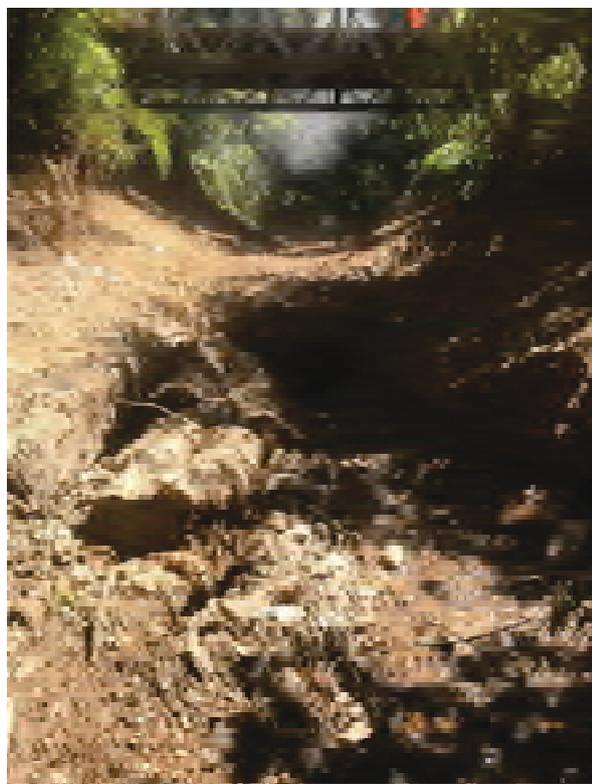

The mini museum at the Wainuiomata Lower Dam was officially opened on 28 February. Park Ranger Ricky Clarkson put a huge amount of work into this project, supported by GWRC and external expertise. The material and information is of Te Papa quality! This is hopefully the start of many more interpretation projects across the parks to tell the stories of our natural and cultural heritage.

Mini museum exhibits and stories at the Wainuiomata Lower Dam

4.4.7 Akatarawa Forest

The work to protect the abutments of Perhams Road Bailey Bridge is complete. A culvert was installed immediately below the bridge, allowing the eroding stream banks to be stabilised.

Perhams Road bridge culvert installation in progress

4.4.8 East Harbour Regional Park

The Mackenzie Track upgrade work in the northern forest continued this period. The mini-digger has proven to be the right tool for this job— given the narrow access widths on this particular track.

Maintenance Ranger David Mackey illustrates the scale challenges on the Mackenzie Track

4.4.9 Kaitoke Regional Park

Every year we receive more than a quarter of a million visitors to Kaitoke; of those there are many who come back time and again. One such repeat visitor is OKC, a programme hosting Japanese children on exchange to New Zealand schools. As part of their stay they do various activities to help understand our culture and environment. For a number of years now, Park Rangers have led several OKC tours in the park over a two week period every March.

OKC Japanese Exchange Students taking undue advantage at Kaitoke Regional Park

GW Plantation Forests

Reflecting a desire to demonstrate best practice plantation forest management, Parks has been working closely with Land Management and the Environmental Regulation team. The aim of this work is leverage our role as land managers and provide informed front line guidance as part of our liaison activities with forest managers PF Olsen.

As PF Olsen has recently started harvesting in Mangaroa Forest, Parks carried out our first official visit, and piloted a new checklist developed by representatives of the three departments. An excellent example of “on the same side”, the checklist gives field staff some confidence in assessing operations and talking PF Olsen about what’s working well and what might need improving.

5. Consideration of Climate Change

The matters requiring decision in this report have been considered by officers in accordance with the process set out in the GWRC Climate Change Consideration Guide.

6. The decision-making process and significance

No decision is being sought in this report.

7. Recommendations

That the Committee:

- 1. Receives the report.*
- 2. Notes the content of the report.*
