

Civil Contractors New Zealand submission on Proposed Change 1 to the Natural Resources Plan for the Wellington Region

Contact: **Fraser May** Communications and Advocacy Manager Civil Contractors New Zealand PO Box 12013 **Wellington**

- Date: 20 December 2023
 - 1. Introduction
 - 1.1 Civil Contractors New Zealand (CCNZ) is the national industry body for horizontal construction, representing more than 500 companies responsible for the physical construction and maintenance of New Zealand's infrastructure networks, including roading, water, public spaces, seawalls, rail networks, forestry roads, wind farms and much more. CCNZ also has more than 300 associate members that supply contractors with equipment and services.
 - 1.2 Funded by its members, CCNZ works to increase understanding of the needs of civil construction companies to New Zealanders, improve industry practices and users' technical knowledge, and assist in developing a highly skilled workforce within a safe and sustainable work environment.
 - 1.3 In addition to national representation, CCNZ also has 12 regional branches, including a Wellington Wairarapa Branch.
 - 1.4 We would like to thank the Greater Wellington Regional Council for the opportunity to comment on the proposed Plan Change 1 to the Natural Resources Plan for the Wellington Region.
 - 1.5 We would like to further discuss the issues raised in this submission with Council.

2. Key Points

Our submission makes the following key points:

2.1 CCNZ considers the proposals in Plan Change 1 will have significant impacts on the region's civil construction industry, will result in increased costs for ratepayers, and are unlikely to result in better environmental or consenting outcomes.

- 2.2 The changes to the definition of earthworks in **2.2** need refinement. These changes will at the least require considerable resource from industry to understand and implement, and at worst, the change to the definitions may greatly escalate project costs.
- 2.3 The addition of 'to a cleanfill area' to 2.2 (i) is problematic, as there are severe constraints around sites in the greater Wellington region at the moment. For the past two years, there has largely only been one cleanfill site, so we have seen instances of contractors required to take fill to other regions, sometimes at distances of 170kms, at great cost to ratepayers.
- 2.4 It is appropriate that well-managed sites should be set up for disposal of cleanfill, but presently this is not the case. The regional availability of cleanfill sites needs to be taken into account before this is written into the plan, or this may significantly hamper the region's ability to deliver infrastructure projects.
- 2.5 **Policy P.P29, WH.P31, WH.R24 and P.R23 (b)** read as no winter works permits will be available. By the guidelines winter works permits are actually only for shutting a job down to make safe. The way this clause is written risks stopping ALL jobs in winter, and this needs clarification. A 'hard shutdown' over winter, where no winter earthworks permits are issued, will render civil construction and earthmoving companies unable to retain staff, and inability to conduct remedial works if site issues do occur.
- 2.6 By our (rough) estimate, more than 90 per cent of earthworks were shut down over 2023 winter in the region. This makes it impossible for companies to retain staff or provide ongoing training and employment to skilled civil construction workers. If civil construction companies are effectively forced to shut their doors over winter months, this will render workers unemployed and increase project costs significantly.
- 2.7 Also, the plan change does not take into account differences in material worked or terrain. It's clear that some winter works must be allowed via resource consents or some other avenue, if the site meets certain criteria. Sand jobs, for instance, have much less sediment and runoff in rainfall, and do not need to be shut down in winter. Winter is actually a better time for these jobs to run, as there is less dust.
- 2.8 We consider a hard shutdown of earthworks sites for four months of the year is excessive. There need to be mechanisms where work can continue if sediment and soil runoff risks can be properly controlled, in particular on sand. These policies and rules should be amended to ensure sufficient and appropriate exemptions exist to provide some ability for winter earthworks in situations where potential sediment can be well managed and controlled. At a minimum, a provision should be added for 'Regionally significant infrastructure'.
- 2.9 The proposed new regulations around vegetation clearance (for instance Rule WH.R18) may require engagement with industry if they are implemented so that contractors can adequately understand their responsibilities around sediment control while working on vegetation clearance sites. CCNZ can support GWRC in this engagement.
- 2.10 Test methodologies should be appropriate to how monitoring occurs on site. Industry uses turbidity as a measure for earthworks consents, whereas Plan Change 1 specifies a measure of total suspended solids (to measure grams of sediment per m3).

Principal Business Partner

The issue with specifying 100g/m3 is that this is a lab test and will take 1-2 weeks to report a result – which is arbitrary because it is based on a point in time.

The correct test methodology for earthworks is Nephelometric Turbidity Units (NTU), which still measures a point in time test but can be implemented in situ for real time testing.

- 2.11 Real-time NTU testing is a much better test to use, as the Total Suspended Solids (TSS) g/m3 measure is purely a lab test doesn't correlate to the on-site measures at all.
- 2.12 Members have advised it is unwise to include an impassable threshold in any standard, because at a point in time, rainfall events or unanticipated weather will throw this measure out. For instance, at certain points in time (for instance flooding) no site would comply *even if there was no discharge from the site itself*, so no work would be able to meet this term in consent.

On this note, it is better to include specific numbers in the guidance on how the standards set by the Natural Resources Plan are implanted on work sites, rather than in the Natural Resources Plan itself.

- 2.13 The other impact is on the type of material being worked e.g. pumice is light, material is light in weight yet it will not exceed the 100g/m3 threshold. Iron sand is heavy, and even a little will exceed the 100g/m3 threshold.
- 2.14 Further to the above, there is not enough lab testing capacity to conduct testing on total suspended solids in the manner suggested in Plan Change 1. It is also unclear who a 'suitably qualified person' for monitoring discharge would be.

If there is a qualification in respect to sediment control in addition to standard measures, it needs to be achievable by contractors, or it will drive up project costs, and increase delays.

3. Specific recommendations

For specific recommendations, please see our comments completed in form 5.

4. The Importance of Cleanfill

Cleanfill is clean (not contaminated) soil removed during earthmoving activities. While it can be reused, it does not have adequate structural properties to be used for building foundations, and it requires good sediment control to stabilise.

Across the Greater Wellington region, civil contractors move upwards of 1,000,000 cubic metres of cleanfill each year from slips, construction projects and other infrastructure construction activities (enough to fill Sky Stadium).

The Greater Wellington region is currently experiencing a major shortage of available cleanfill disposal sites, with a single significant site left in Wellington near the Southern Landfill. This is greatly escalating project costs.

Council should identify and explore appropriate sites for cleanfill disposal and enable these, the alternative being that the region's ability to construct infrastructure will be significantly hampered, escalating costs, impacting council projects, local businesses and regional development, as well as private developers.

Principal Business Partner

We appreciate sediment control is an important factor when planning land use for cleanfill sites, and would encourage GWRC to provide more clarity about appropriate locations and conditions for these sites.

5. Conclusion

Thank you for the opportunity to make this submission. We consider this to be a matter of importance, not just for civil contractors, but for the future development of the region, and we would be happy to provide any further information if required.

We would also be happy to appear in person to support this submission and further discuss the impacts this proposed plan change may have on the region's civil contractors, and their ability to construct and maintain civil infrastructure.

Kind regards,

Fraser May Communications and Advocacy Manager Civil Contractors New Zealand Inc. <u>Fraser@civilcontractors.co.nz</u> 027 8222 107

, ,	New	Select stance	Part 1 Schedule 1	Also, test	Regarding test methodology, the correct test methodology for earthworks is
earthworks sites.				how monitoring occurs on site. Industry uses turbidity as a	Nephelometric Turbidity Units (NTU), which still measures a point in time test but can be implemented in situ for real time testing. Real-time NTU testing is a much better test to use, as the Total Suspended Solids (TSS) g/m3 measure is purely a lab test doesn't correlate to the on-site measures. The plan should either not specifiy which sort of test is used and leave this to implementation guidance, or refer to the correct on-site test method. Consider removal or shifting to an acceptable monthly/annual average rather than a 'point in time' measure that lacks meaning.
Policy P.P29: Winter shut down of earthworks.	New	Amend	Part 1 Schedule 1	A complete hard shutdown of earthworks between 1 June and 30 September is inappropriate, and CCNZ strongly opposes this as many works may be able to continue during this period with no adverse effects, if good sediment control measures are put in place.	Amend policy P.P29 (a), which is excessive. Earthmoving companies will not be ab

,	New	Select stance	Freshwater		
discretionary activity. Rule P.R21: Plantation Forestry on highest	New	Select stance	Freshwater		
erosion risk land – prohibited activity. 9.3.5 Earthworks	New		Both		
Rule P.R22: Earthworks – permitted activity.	New	Select stance	Freshwater	As discussed in relation to the earthworks definition, many earthworks activities undertaken by contractors working for local authority transport teams and Waka Kotahi NZ Transport Agency with significan public benefits, but minor effects would be unable to met the permitted activity conditions of proposed Rule P.R22. This includes minor repairs and maintenance of three waters infrastructure.	Amend the definition of earthworks that governs Rule P.R22, to reinstate the exemptions for certain earthworks activities as exist for 'other Whaitua', including for the thrusting, boring, trenching or mole ploughing associated with cable or pipe laying and maintenance, and for the construction, repair, upgrade or maintenance of pipelines. Any consequential amendments, to other relevant provisions, which are in general accordance with this request.
Rule P.R23: Earthworks – restricted discretionary activity.	New	Select stance	Part 1 Schedule 1	The hard shutdown of earthworks between 1 June and 30 September is inappropriate, and CCNZ strongly opposes this as many works may	Amend policy P.R23 (b), which is excessive. Earthmoving companies will not be able to retain staff over a hard four month shut down. There should be good professional standards around sediment control when earthmoving, and there should be mechanisms where work can continue if sediment and soil runoff risks can be properly controlled, in particular on sand. If amend, ensure sufficient and appropriate exemptions exist to provide some ability for winter earthworks in situations where potential sediment can be well managed and controlled. At a minimum, a provision should be added for 'Regionally significant infrastructure'. This matter needs significantly more attention as a hard shut down of earthworks is not good enough and this can be better managed to maximise positive effects and minimise impacts on professional earthmoving businesses. Regarding the test methodology described in (a), the correct test methodology for earthworks is Nephelometric Turbidity Units (NTU), which still measures a point in time test but can be implemented in situ for real time testing. NTU testing is a much better test to use, as the Total Suspended Solids (TSS) g/m3 measure is purely a lab test doesn't correlate to the on-site measures, and will add significant off-site time and cost to projects. The plan should either not specifiy which sort of test is used and leave this to implementation guidance, or refer to the correct on-site test method.
